FINITE ELEMENT METHODS

(Common to ME, AE, MSNT)

Time: 3 hours

Max. Marks: 75

Note: This question paper contains two parts A and B.

Part A is compulsory which carries 25 marks. Answer all questions in Part A. Part B consists of 5 Units. Answer any one full question from each unit. Each question carries 10 marks and may have a, b, c as sub questions.

PART - A (25 Marks)

- 1.a) What is the principle of finite element method? [2]
- b) Write the stress strain relations for 2 D plane stress and plane strain conditions. [3]
- c) Differentiate between truss and beam element based on degree of freedom. [2]
- d) What is Hermite shape function? [3]
- e) Write the formula for the load vector of a triangular element subjected to body force. [2]
- f) What is the size of the stiffness matrix for axisymmetric triangular element? [3]
- g) What is the degree of freedom for the thermal problems? [2]
- h) Where do you apply finite element analysis for thermal problems? [3]
- i) Explain convergence requirement. [2]
- j) Explain the importance of lumped mass matrix. [3]

PART - B (50 Marks)

- 2.a) Why polynomial type of interpolation function is preferred over trigonometric functions? Explain.
- b) Draw the Pascal's triangle and Pascal's tetrahedron for understanding the interpolations functions. Explain the salient features. [5+5]

OR

- 3.a) Explain the steps involved in obtaining an approximate solution using finite element method.
- b) Explain the equilibrium state of the system, when the system is subjected to different types of loads and explain the stress and equilibrium relations. [5+5]

4. For a two-dimensional truss structure, as shown in the figure 1, determine displacements of the nodes and normal stresses developed in the members using FE. Use $E = 30 \times 10^6 \text{ N/cm}^2$ and a diameter of the circular cross-section of 0.25 cm. [10]

Figure 1
OR

5. A beam is fixed at one end and supported by a roller at the other end, has a 20 kN concentrated load applied at the centre of the span of 10 m. Calculate the deflection and slope and also construct shear force and bending moment diagrams. Take $I = 2500 \text{ cm}^4$ and $E = 20 \times 10^6 \text{ N/cm}^2$. [10]
- 6.a) Evaluate the axisymmetric stiffness matrix \mathbf{K} of the triangular element shown in the figure 2. Consider the coordinates of nodes as 1 (2, 1), 2 (4, 0), and 3 (3, 2). Also assume $E = 2.6 \text{ GPa}$ and $\nu = 0.2$.

Figure 2

- b) Differentiate between CST and LST with respect to the triangular element. [5+5]
- OR**
7. Derive the stiffness matrix for the four noded quadrilateral element in terms of natural coordinate system. [10]
8. Consider a brick wall of thickness 0.3 m, $k=0.7 \text{ W/m K}$. The inner surface is at 28°C and the outer surface is exposed to cold air at -15°C . The heat transfer coefficient associated with the outside surface is $40 \text{ W/m}^2 \text{ K}$. Determine the steady state temperature distribution within the wall and also the heat flux through the wall. Use two elements and obtain the solution. [10]
- OR**
9. Derive the conductivity matrix for two dimensional triangular element subjected to convection on one face of the element. [10]
10. For the stepped bar shown in the figure 3. Develop the global stiffness and mass matrices and also determine the natural frequencies and mode shapes. Assume $E = 200 \text{ GPa}$ and mass density $= 7850 \text{ kg/m}^3$, $L_1 = L_2 = 0.3 \text{ m}$, $A_1 = 350 \text{ mm}^2$, $A_2 = 600 \text{ mm}^2$. [10]

Figure 3

- OR**
- 11.a) Derive the shape functions for the four noded tetrahedron element from the first principles.
- b) Discuss the importance of semi automatic meshing and auto mesh along with the practical applications. [5+5]
