**R13** Code No: 118DZ JAWAHARLAL NEHRU TECHNOLOGICAL UNIVERSITY HYDERABAD B. Tech IV Year II Semester Examinations, May - 2017 PRODUCTION PLANNING AND CONTROL (Common to ME, MCT) Max. Marks: 75 Time: 3 hours Note: This question paper contains two parts A and B. Part A is compulsory which carries 25 marks. Answer all questions in Part A. Part B consists of 5 Units. Answer any one full question from each unit. Each question carries 10 marks and may have a, b, c as sub questions. Differentiate between the production planning and production control. [2] 1.a) How the "controlling" can be done to regulate the progress of work? [3] b) Give the step by step Forecasting procedure for using time series [2] c) A forecaster is using an exponential smoothing model with a = 0.4 and wishes to convert d) to a moving average. What length of moving average is approximately equivalent? What do you understand by the term operating doctrine in the inventory modelling? [2] e) Do JIT enhance return on investment (ROI)? Explain. f) [2] What are the assumptions in flow shop scheduling? g) [3] Compare infinite loading and finite loading. h) What are the methods to take corrective action in follow-up? [2] i) Differentiate between centralized and decentralized dispatching. [3] j) (50 Marks) Briefly explain the prerequisites of PPC. 2.a) Explain the production lifecycle with the aid of a graph. [5+5]b) OR "PPC regulates and controls "how," "where," and "when" work is to be done," What do 3.a) you understand by this statement? State the principles of good production planning and control. b) What are the levels of aggregation in forecasting for a manufacturing organization? How 4.a) should this hierarchy of forecasts be linked and used? List out the advantages and disadvantages of short term long term forecasting. [5+5] b) A firm uses simple exponential smoothing with  $\alpha = 0.1$  to forecast demand. The forecast for the week of/February 1 was/500 units, whereas actual demand turned out to be 450 units. a) Forecast the demand for the week of February 8. b) Assume that the actual demand during the week of February 8 turned out to be 505 units. Forecast the demand for the week of February 15, Continue forecasting through March 15, assuming that subsequent demands were actually 516, 488, 467, 554 and 510 units.
