### Engineering Graphics

**Lecture Notes** 

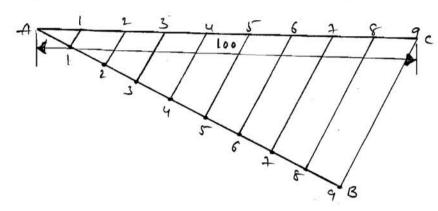

## UNIT-I

#### **Content**

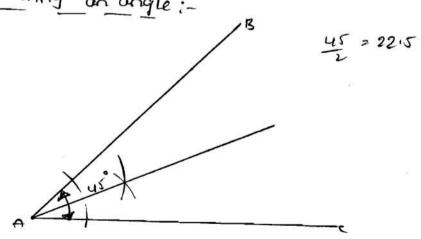

Introduction to Engineering Drawing: Principles of Engineering Graphics and their Significance, Conic Sections including the Rectangular Hyperbola – General method only. Cycloid, Epicycloid and Hypocycloid, Scales – Plain & Diagonal.

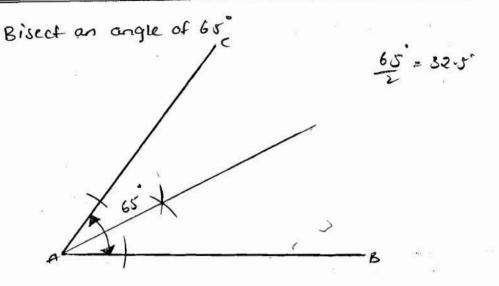

# 40 projectionline. Suare. 60 Rectangle R30 \$60

Divide a line into Number of exual Parts
11=9

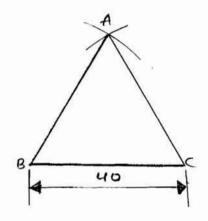

Bisecting an angle:-

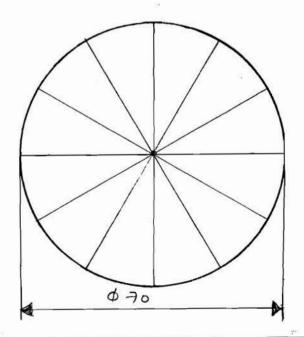

Construct an equilated though of side 40 mm

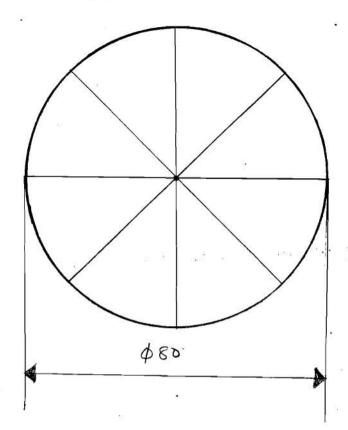

Divide a circle of clianetes form into 12 excel Parts h = 12 excel parts

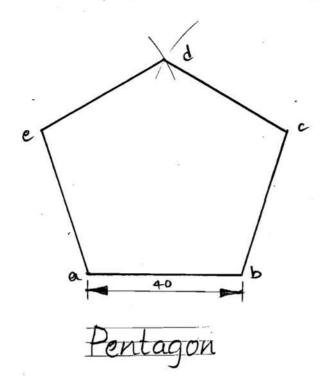

Divide a circle of diameter somm into seemed parts.

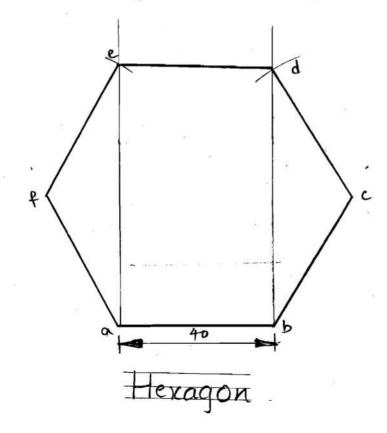

N = 8 esual loub

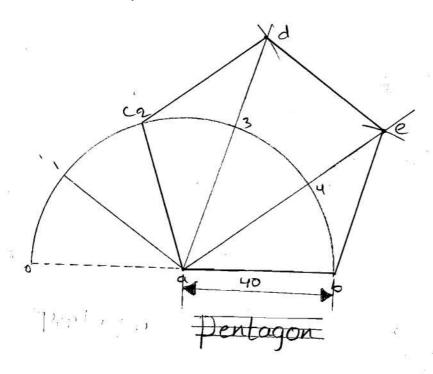

#### Construct a Pentagon of side 40mm

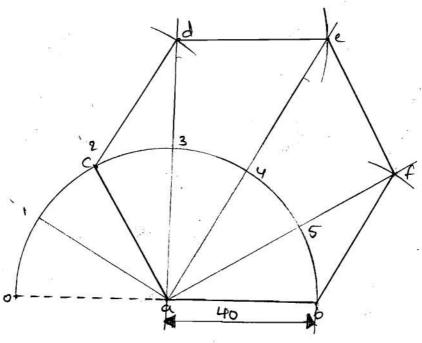

Construct a Hexagon of side 40mm

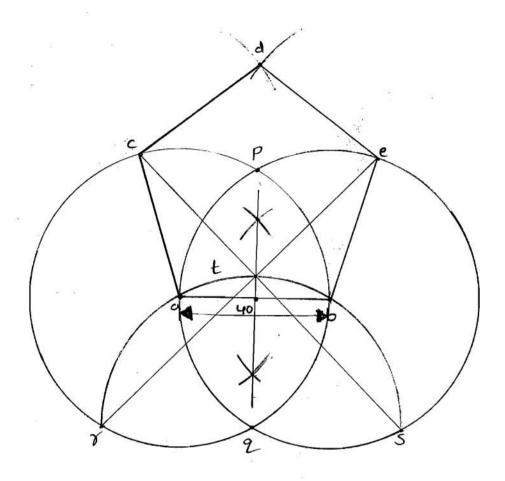

Draw a regular Pentagon and regular Heragon having 40mm side length

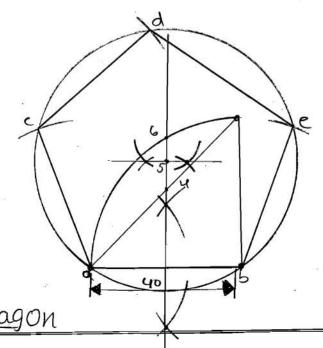

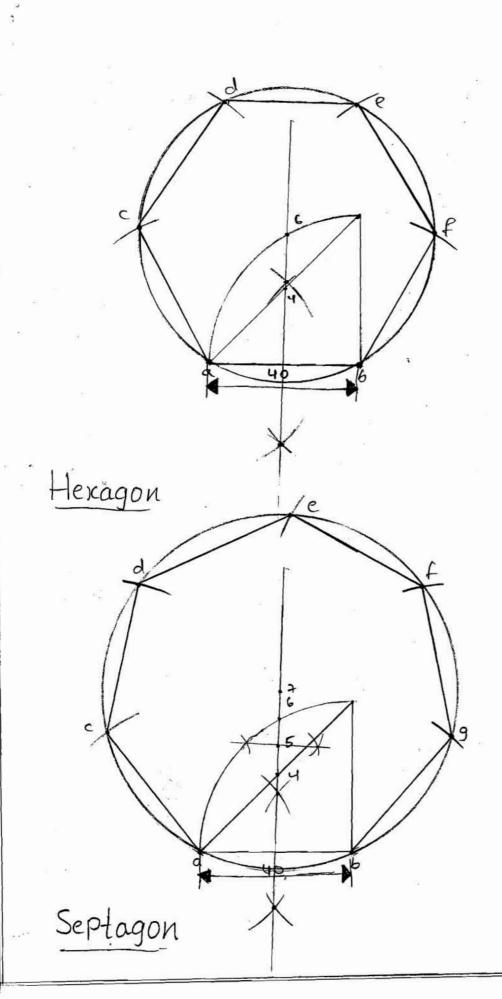

Hexagon.

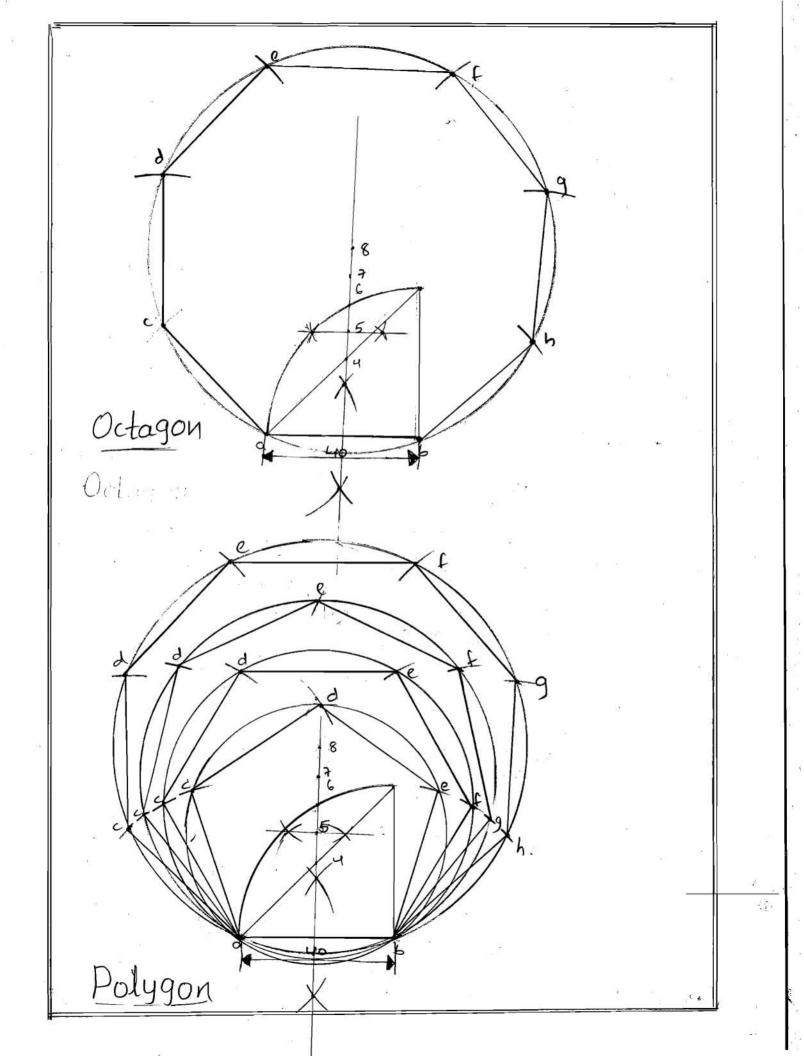

Q:- Drow a regular pentagon of side womm by using arcs of circle method

=> special method of construction of any polygon.

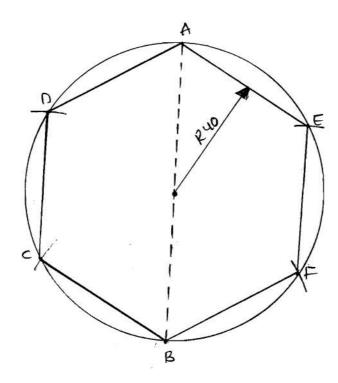

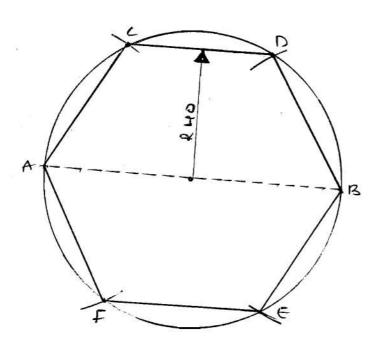

Construct a Heragon of side 40mm

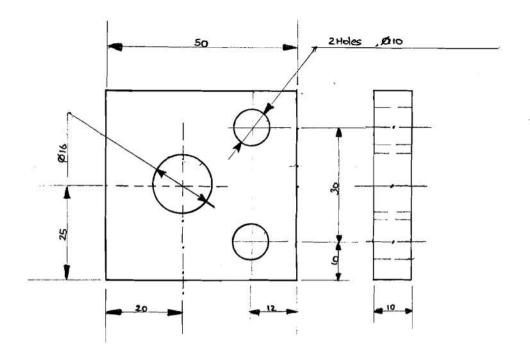

- a) side is verticel.
- b) side is Horitontal.

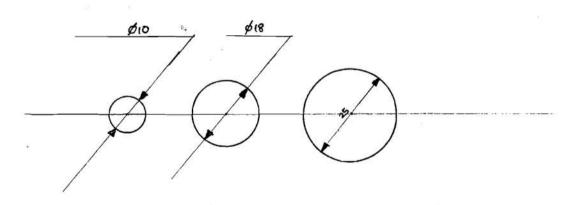

a)

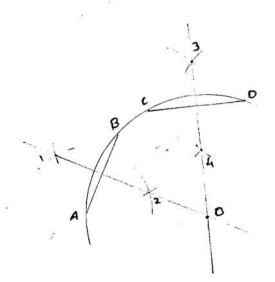

6)

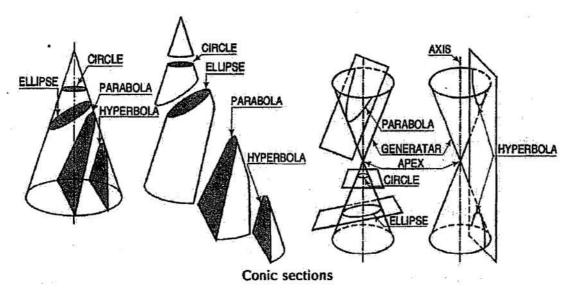

#### Unit-I

#### **Conic Sections:**

The section obtained by the intersection of a right circular cone by a plane in different positions relative to the axis of the cone are called conics.

- (i) When the section plane is inclined to the axis and cuts all the generators onone side of the apex, the section is an ellipse
- (ii) When the section plane is inclined to the axis and is parallel to one of thegenerators, the section is a parabola
- (iii) A hyperbola is a plane curve having two separate parts or branches, formedwhen two cones that point towards one another are intersected by a planethat is parallel to the axes of the cones.

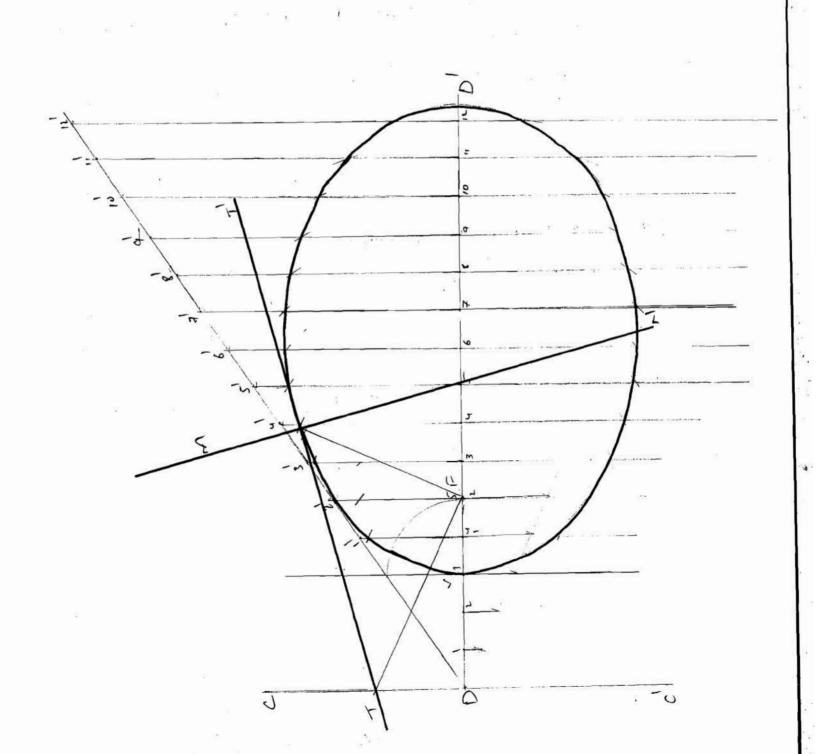

The conic may be defined as the locus of a point moving in a plane in such a waythat the ratio of its distances from a fixed point and a fixed straight line is always constant. The fixed point is called the focus and the fixed line, the directrix.

The ratio distance of the point from the focus distance of the point from the directrix is called eccentricity and isdenoted by e. It is always less than 1 for ellipse, equal to 1 for parabola and greaterthan 1 for hyperbola i.e.

- (i) ellipse :e < 1
- (ii) parabola : e = 1
- (iii) hyperbola : e > 1.

The line passing through the focus and perpendicular to the directrix is called the axis. The point at which the conic cuts its axis is called the vertex.

Draw a ellipse when the distance of its focus from its directorix is somm and eccentricity is 2/3 also, draw is tangent and a normal to the ellipse at point 70mm away from directorix.

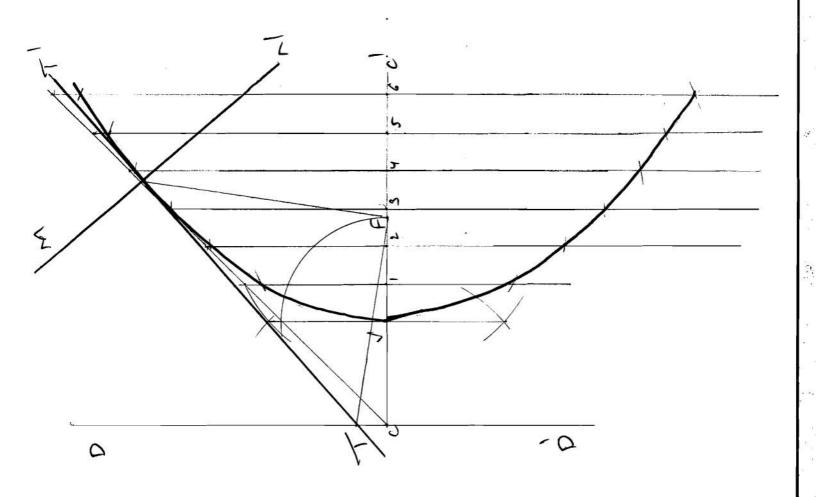

- 1. Maw focus P on ours AB such that AF = 50mm.
- 2. Divide AF in 5 equal parts mark vertex v, on 3rd division from A and Draw vertical line vie equal to vif . Join A to e and produce it to some distance.
  - 3. Mark a point 1 anywhere on line AB (less than 1cm). Drow a perpendicular line through 1 and meet AE produced at pointi.
    - 4. with contre f and sadius 1-1', draw curcs to intersect the perpendicular line 1-1' at points P, and P,1. These cure the loci points of ellipse
      - 5. similarly, mark other point. These gives some more loci points of ellipse like; p2 and p2', p3 and p3', p4 and pu', etc.
      - 6. Join all the ber points of ollipse and obtain the required ollipse and the required ollipse

Pangent and normal to an ellipse.

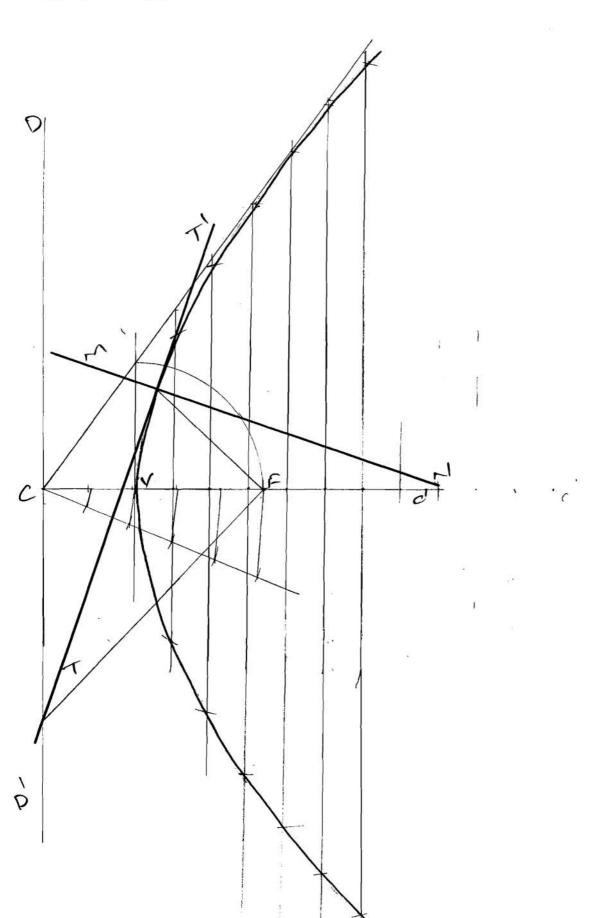

- 1. Mark a point P on ellipse at 70 mm from directoric and join Pf.
- 2. Drows a line FT perpendicular to line PF to meet directorise DD' at point T.
- 3. Doin TP and produce to some point T'. The line TI' is required tangent.
  - 4. Through point p, draw a line NN' perpendicular to TT'.

    The line NN' is three required normal.

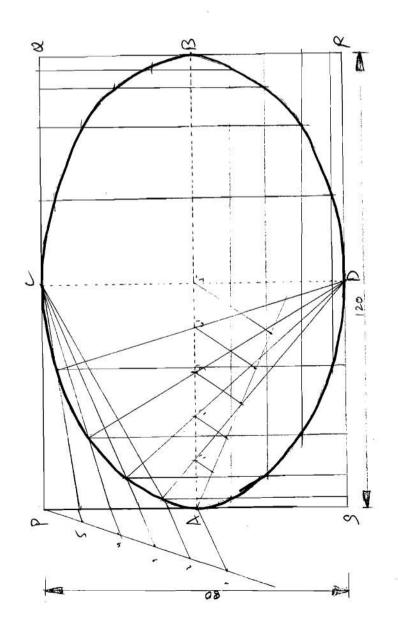

Diaw parabola when the distance between its focus and directorix is 55 mm also a tangent and a normal at a point 65mm from directorix.

Draw a hyperbola when the abstrace of its focus from its directric is semm and eccentricity is 3/2 also draw a tangent and a normal to the hyperbola at a point somm from the directric.

Draw an allipse having 120mm long major axis and 80mm minor axis.

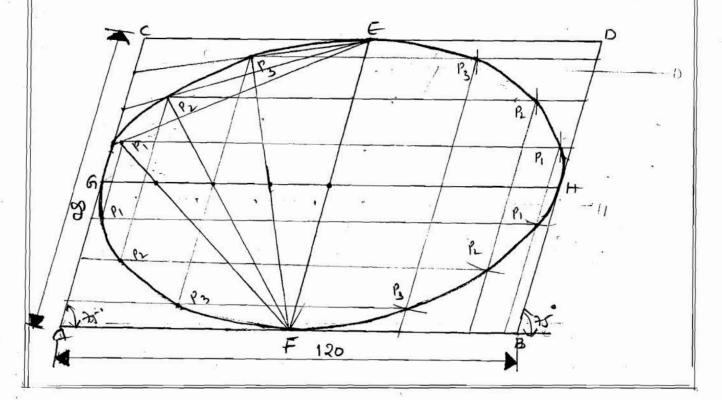

The sides of a Parallelogram are 120 mm x somm. The Included angle between them is 75°. Inscribe an ellipse. In the given ligram.

F

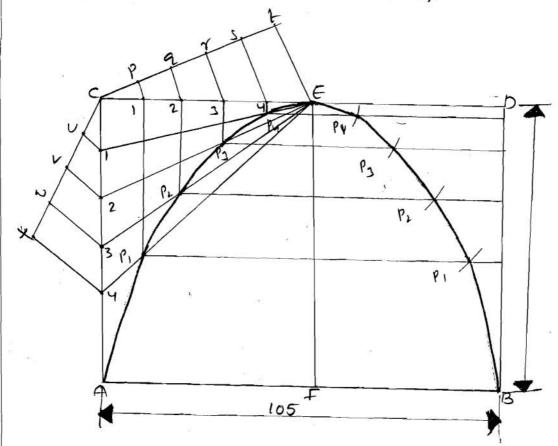

160

4:

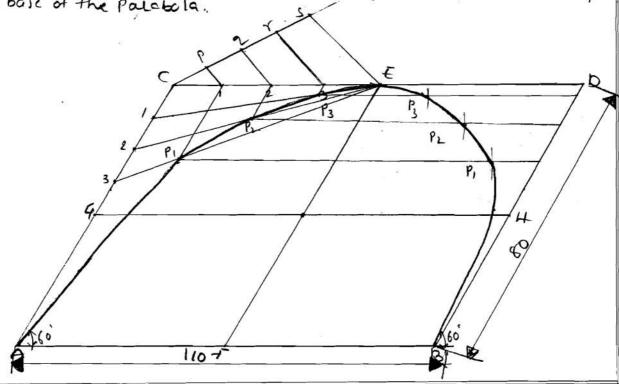

Q:

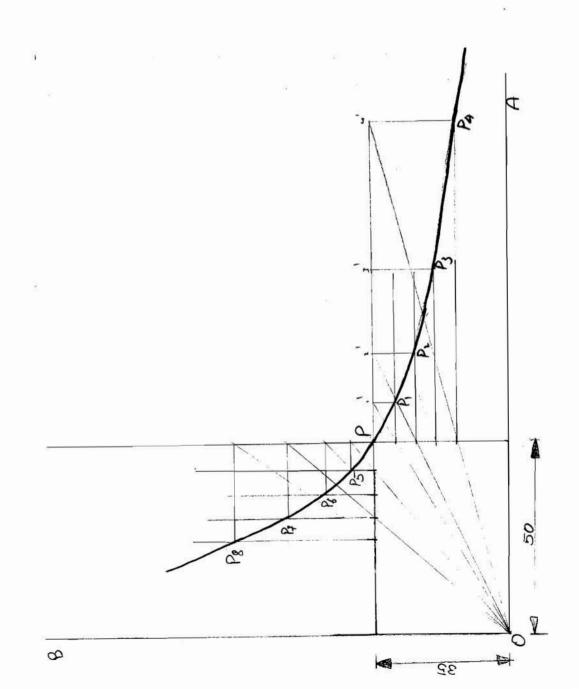

Draw a parabola given the width and height of its enclosing rectangle as 105mm x75mm respectively.

Inscribe a Parabola in a Parallelogram of 110 x 80 mm sides, The Included angle being 60. Consider the longer side of the Parallelogram as base of the Palabola.

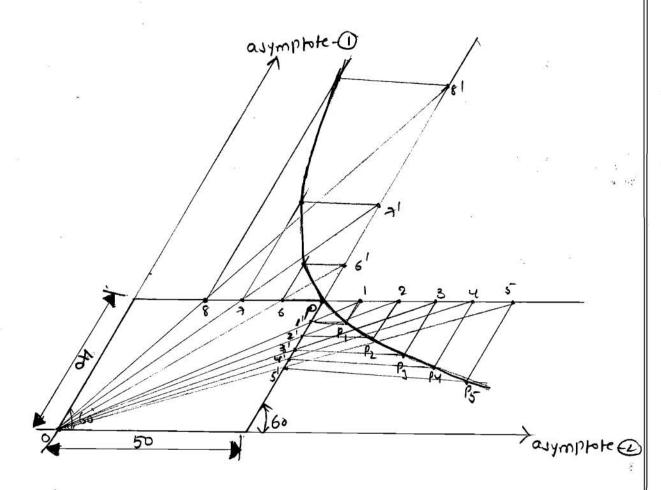

A point P of the hyperbola is situated at a distance of 35mm and 50mm from the paix of asymtodes. The asymtodes are perpendicular to each other. Draw hyperbola using orthogonal asymboles method.

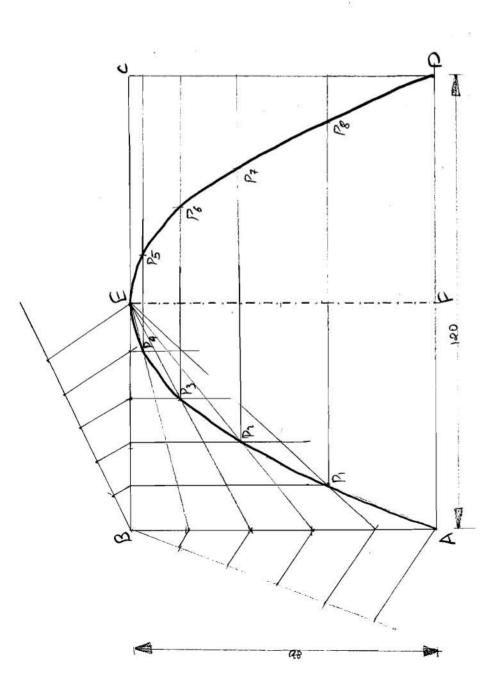

- " Draw asymptotes of and DB perpendicular to each other.
- 2. Mark P such that DA = 35 mm and OB = 50 mm.
- 3. Draw cD, et parallel to OA, OB respectively pass through P.
- 4. mask points 1,2,3,etc..., on PD at equal distance.
- 5. Join 01,02,03 etc., to intersect the line ep at 1',2',3'etc.
- 6. Draw lines from points 1,2,3,etc., parallel to 013 to interest lines drawon from points 1,2,3 parallel to 014 at points P, P2, P3-etc.
- 7. mark point 9,6,7 etc., on cp at aqual distance.
  - 8. Repeat step 5,6 with 5,6,7. etc points. you will get
  - a. 15,1P6, P4.,0tc
  - q. Draw a smooth curve passing through P. 192, P3, P5, P6, Pa... etc., to get required sectangular hyperbola.

Draw a hyperbola when its asymptotes are Inclined at 60 to each other and it passes through a point p. At a distance of 40mm and 50mm from the Asymptotes.

Hyperbola.

Draw a parabola of base reomm and axis somm by rectangular method.

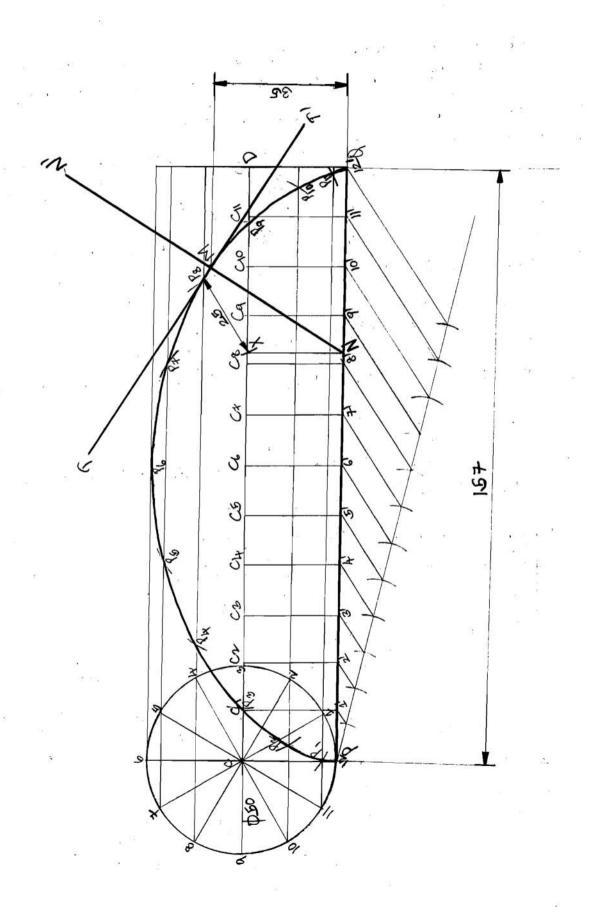

- 1. Draw a rectangle ABCD taking A = 120 mm and AD = 80 mm
- 2. Mark fand fas the midpoints of As and co respectively. Toin of to represent the axes.
  - 3. Divide FD and DA, into equal number of parts, say 4.

    Mark division of side DA as 1,2,3 and divisions of FD as

    1',2',3'. Now join F with points 1,2,3.
  - 4. Through 1', 2', 3' draw lines parallel to axis Ep to meet f1, f2, f3 at P1, P2, P3 respectively.
    - 5. As the cooke is symmetric about outs, obtain points Pi'192', P3' of the curve by drawing horizontal lines through points P1, P2, P3 and making them equal on both side of outs EF.
      - 6. Doaw a smooth curve passing through A,P3,P2,P,F,P,',P2', P3' and B to get the required parabola.

#### Cycloids:

These curves are generated by a fixed point on the circumference of a circle, whichrolls without slipping along a fixed straight line or a circle. The rolling circle iscalled generating circle and the fixed straight line or circle is termed directing lineor directing circle. Cycloidal curves are used in tooth profile of gears of a dial gauge. sevolution also draw a tangent and a normal to the curve at a point 35mm above base line,

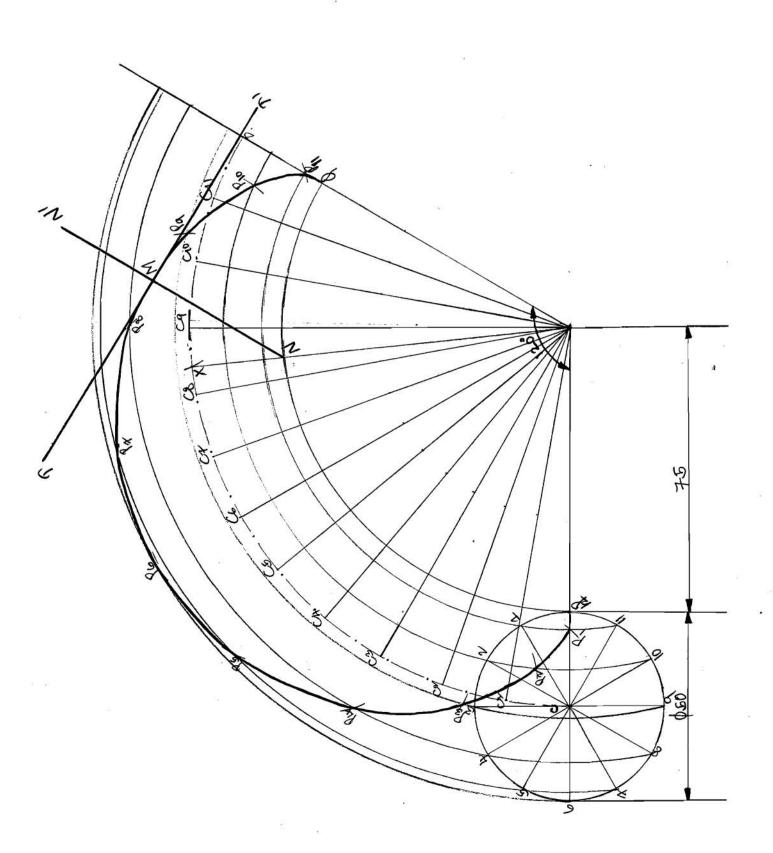

- 1. Draw a circle of diameter somm with centre c.
- 2. Draw the directing line pg=110=157mm long, horizontal and tangential to the circle.
- 3. Divide the circle into 12 equal parts and mark the divisions as 1,2,3 etc. Draw lines through points 1,2,3,etc., parallel to PQ.
- 4. Divide po into 12 equal parts and mark the divisions as 1', 2', 3, etc.
- s. Exect vextical lines from points 1', 2', 3' etc. to meet the centre line co at c,,c2,c2, etc. when the circle rolls through 1/12th rotation, point 1 of the circle will coincide with 1' centre c will move to c1. The point p will move to new position p, lying on the horizontal line through point 1 at a distance of 25 mm from c1.
  - 6. Draw an asc with centre c, and radius 25mm to intersect the horizontal line through point 1 at point P,.
  - 7. Similarly, down our with centre cz, cz, cy etc.
  - s. Diaco a smooth consue passing through p, pa, p3, pu et c. to get the required cycloid.

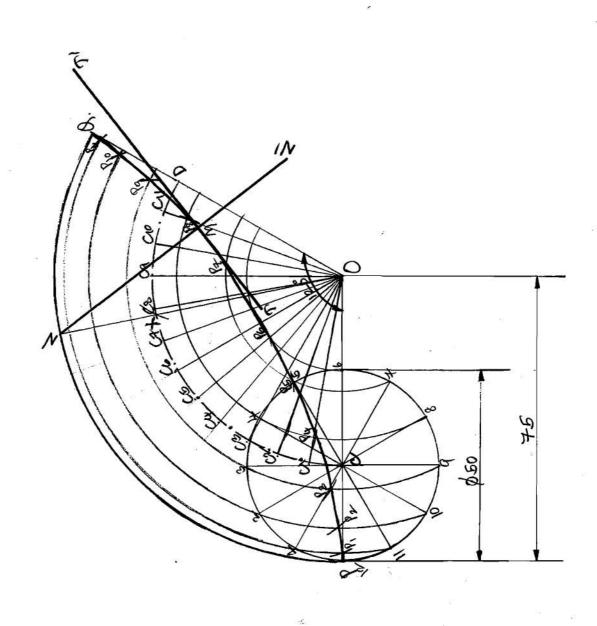

Pangent and normal to the cycloid:

- 1. mark a point M on the cycloid 35mm above PQ.
- 2. Prow an arc with centre M and radius esmm, to intersect the centre line at X.
- 3. Draw a vestical line from x to meet Mg at N.
- 4. Join NM and produce to N'. This line NN' is the required normal.
- 5- Through point M drows a line TT perpendicular to NN1. This line TT is the required tengent

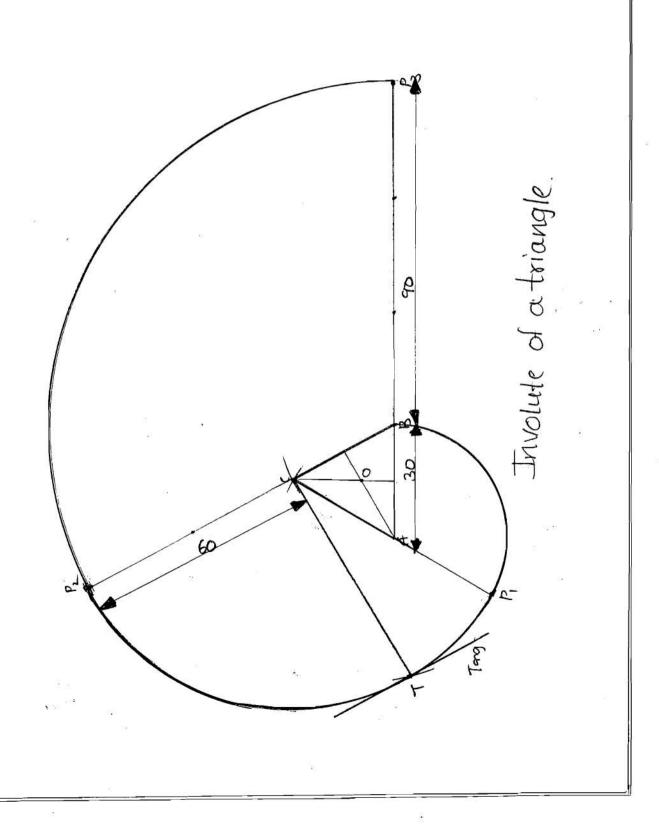

Deaw an epicycloid of a circle of diameter somm which rolls outside a circle of diameter 150mm for one sevolution also draw a tangent and normal to epicycloid at a point 110mm from the centre of direction circle.

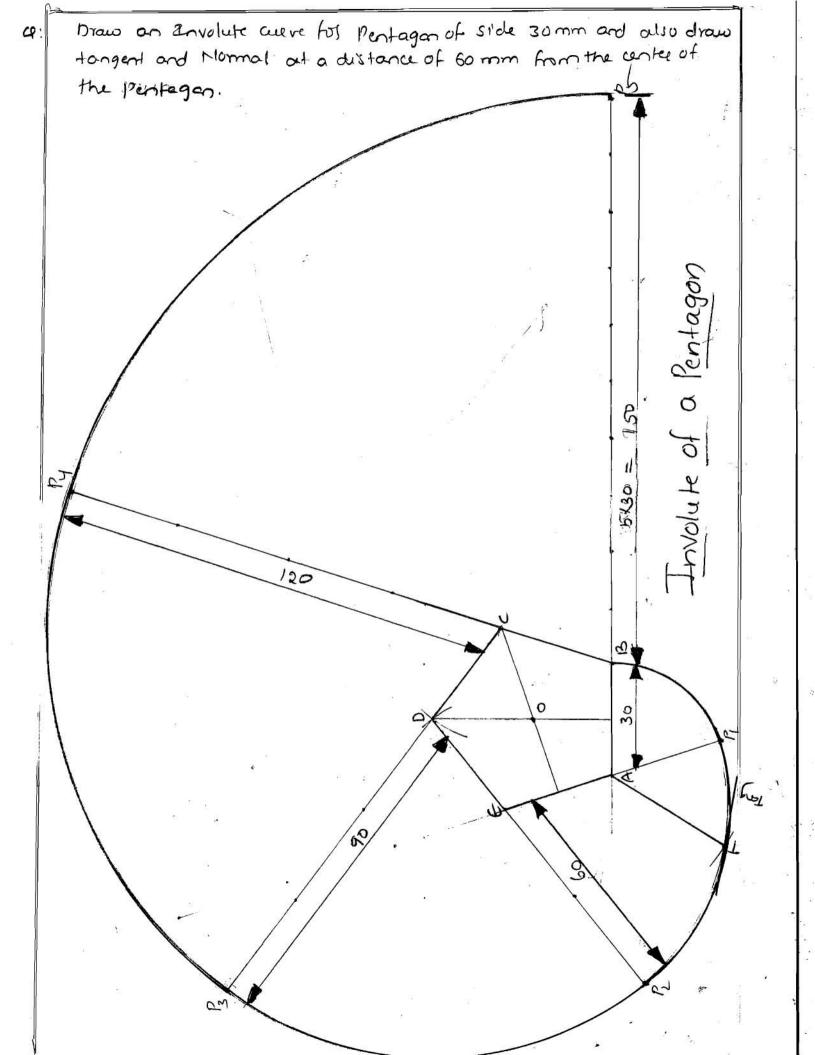

Drace a hypocycloid of a circle of diameter somm which rolls inside a circle of diameter on somm for one revolution also draw a tangent and normal to hypocycloid of a point 40mm from the centre of the directric circle.

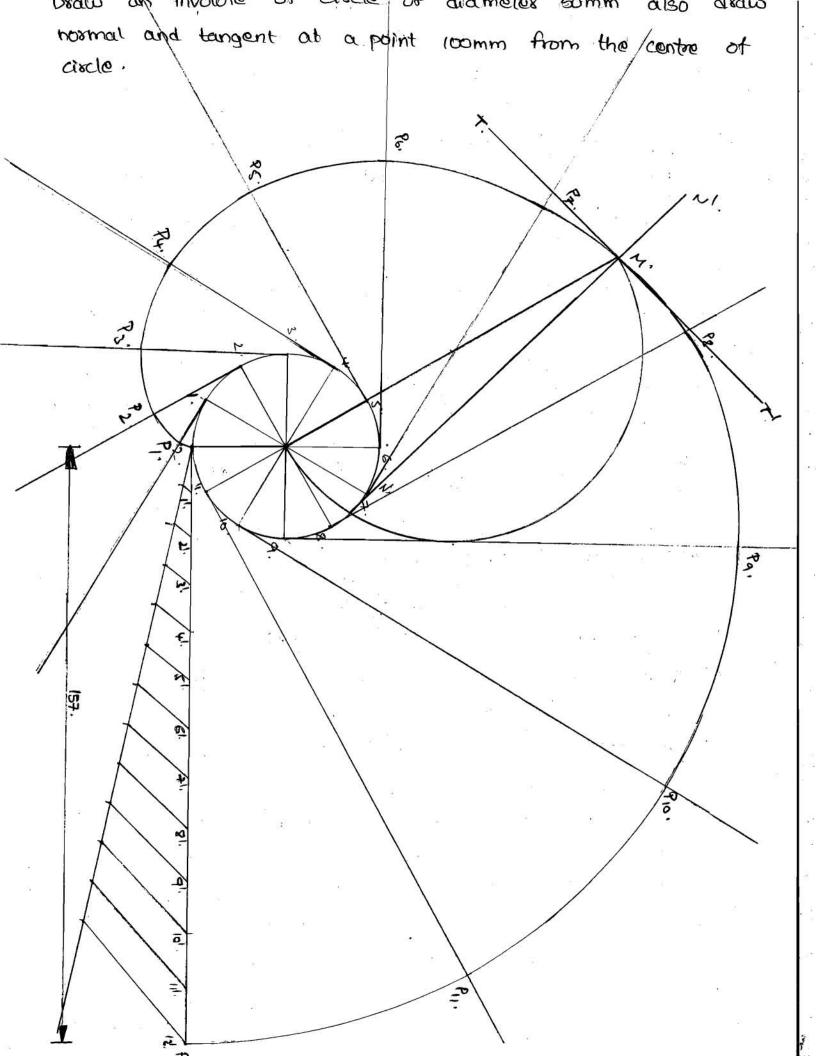

Draw an Involute for a triangular plane of side length 30 mm and also draw tangent and Normal at a Point 55 mm from the center of the hiorigue.

construct on anvolute curve for a square of side 30 mm and also draw tangent and Normal at a distance of 60 mm from the center of the square. 20 90

- and mark them as 1, 2, 3., etc.
- 2. Docume line pg=1TD = 157mm. divide it into 12 equal parts. mounts them as 1', 2', 3'..., etc.
  - 3 booms targents to circle at 1,0,3 etc.
  - 4. Deaw on arc with centre 1 and radius prito intersect the tangent point i at pi
    - 5. Draw an auc with contre a and radius Pa' to intersect the tangent line through point a at Pa.
    - 6. Similarly, down are with controls 3,415 etc and radii' pz', pu', p5'etc., respectively to intersect the tengent line through points 3,415 etc., at points p3, pu, ps etc., respectively.
      - 7. Doaw a smooth curve to pass through P., P., P., P. . etc., and detain required involute.

## Pangent and normal to involute:

- 1. Mark a point M on involute at sadial distance 100m from 0.
- 2. Soin om and mark o, as its mid point.
- 3. Draw a semi-circle in closewise direction with 0, as centre and diameter on to intersect the base circle at N.
- 4. John MN and produce it to N'. The line NN' is the required normal.
- 5. Through point M, draw a line 771 perpendicular to NN'
  The line TT! is required temport.

#### Scales:

Drawings of small objects can be prepared of the same size as the objects theyrepresent. A 150 mm long pencil may be shown by a drawing of 150 mm length. Drawings drawn of the same size as the objects, are called full-size drawings. Theordinary full-size scales are used for such drawings.

A scale is defined as the ratio of the linear dimensions of element of the objectas represented in a drawing to the actual dimensions of the same element of the object itself.

Representative fraction: The ratio of the length of the object represented on drawing to the actual length of the object represented is called the Representative Fraction (i.e. R.F.).

 $R.F. = \frac{\text{Length of the drawing}}{\text{Actual length of object}}$ 

#### Types of scales

The scales used in practice are classified as under:

- (1) Plain scales
- (2) Diagonal scales
- (3) Vernier scales

A 2 cm length of the drawing represents 5m length of the object. Thus find P.f value.

Sal

$$R \cdot f = \frac{1 \text{ cm}}{5 \text{ m}}$$

$$= \frac{1 \text{ ch}}{500 \text{ ch}}$$

$$\cdot \frac{1 \cdot f}{500} = 1:500$$

A 5cm long line represents 3 km length of a Road find the R.F Value.

Sol:

3.

Find the P.f value of a 1 cm = 1 m R.f = Length of the object in drawing Achiel length of object. P.F = 1cgg  $R \cdot f = \frac{1}{100}$ 

4. In a map of Endia, a distance of 36 km between two localities is shown by a line of 45 cm long calculate its R.F.

R.f = Length of the object in drawing Actual Length of the object

5. A lectangular Plot of 100 km² is represented by a rectangular acce of 4 sq cm. Find the P.F.

Rectangular Plot = 100 km²
Arca of brawing = 4 cm²

$$R \cdot f = \frac{2 \, \text{cm}}{10 \, \text{km}} = \frac{2 \, \text{cm}}{10 \, \text{km}} = \frac{1}{5 \, \text{km}^5}$$

6. A cube of 5 cm side represents a tonk of 8000 cum Volume-Find the R.F

cube side length = 5cm

Tank volume = 8000 m3

$$= \sqrt[3]{\frac{5^3 \text{ cm}^3}{8000 \text{ m}^3}} = \frac{5 \text{ cm}}{20 \text{ m}} = \frac{3 \text{ cm}}{20 \text{ m}} = \frac{3 \text{ cm}}{20 \text{ m}}$$

on the map is 15cm and 8cm respectively. Find the value of P.T.

$$R \cdot f = \sqrt{\frac{15^2 \times 8^2 \text{ cm}^2}{50,000 \text{ m}^2}}$$

$$e \cdot f = \frac{1}{5} \sqrt{\frac{3}{50}} \times \frac{c/h}{100 c/h} = \frac{1}{500} \sqrt{\frac{3}{50}}$$

:. 
$$R \cdot f = \frac{1}{500} \sqrt{\frac{3}{50}}$$

8. A Room of 1728m3 volume is shown by a cube of 4cm side. Find the R.f.

$$R \cdot f = \sqrt[3]{\frac{L^3 \text{cm}^3}{1328 \text{ m}^3}}$$

$$= \sqrt{3 \frac{\sqrt{3} \text{ cm}^3}{3^3 \text{ cm}^3}}$$

### Plain scale:

construct a scale of 1:60 to show meters and decimeters and long enough to measure up to 6m. Mark on i'll a distance of uitm, 3.6m.

Ans R-F = 1/60

3

Long enough to measure up to 6m

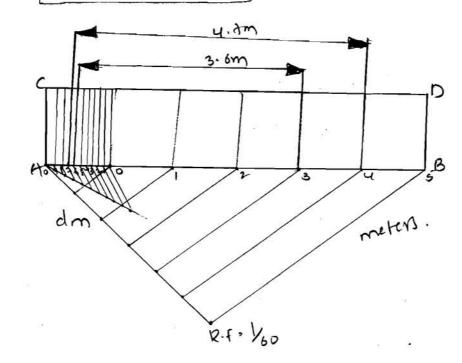

Mark a distance = 4.7m, 3.6m.

R-F = L.O. J. D

A.LO (01) Max length of object.

$$\frac{1}{60} = \frac{1.0.J.D}{6m}$$

L.O.I.D = 10m = 10m

2. construct a scale of 1 cm = 1m to read meters and decimeters and long enough to measure up to 1 um. show a distance of 12.um.

A: 1 cm = I meter.

Man length = 14m

Marking distance = 12,4 m

Actual length of object

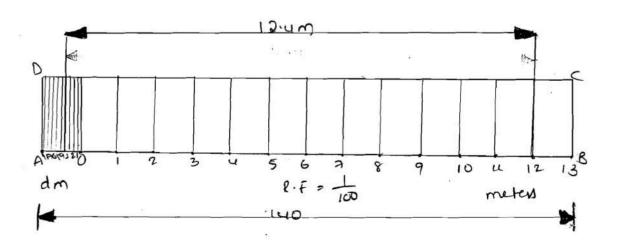

18.f = 1cm = 1color = 100

100 = L.O.I.D

100 = L-0.I.D

1.0.7.D = 14 x 100cm = 14 cm

L.0 J. 0 = 140mm.

Reference of 1 decameter (om) is Represented by 5cm. Find the Reference construct a plainscale to measure up to 2.5 pm and mark a distance of 19m on it.

A: R-f = ?

1 Dm = 5cm

R-f = Length of object in drawing Actual length of object.

 $R.f = \frac{5cm}{20m} = \frac{5}{1000}$ 

R.f = 100

 $\frac{1}{2\omega} = \frac{L \cdot o \cdot I \cdot o}{2 \cdot 5 \text{ pm}}$ 

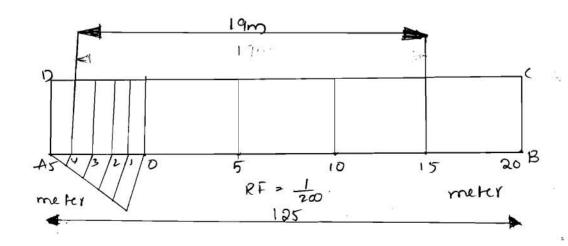

200 - 5.

2 2.5 x 1060cm

L.O. I.D = 12,5cm (OY) 125 mm

maklength = 2.50m

marking distance = 19m.

A rectangular plot of 100 km² is represented by a rectangular area of 4 cm². Draw a scale to show 50 km and mark a distance of 41 km on it.

A:

$$R.f = \frac{2cm}{101cm} = \frac{1}{5\times10^{5}}$$

marling distance = 41 km.

P.F = length of object in drawing Actual length of object

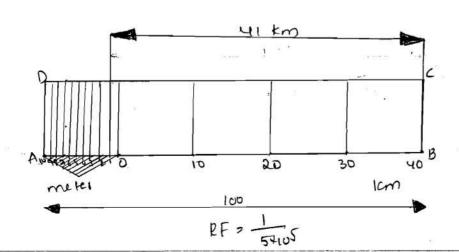

$$\frac{1}{54.05} = \frac{1.0.1.D}{50 \text{ km}}$$

$$\frac{1}{54.05} = \frac{50 \text{ km}}{50 \text{ km}}$$

$$\frac{1}{54.05} = \frac{50 \text{ km}}{54.05}$$

$$= 10 \text{ km}$$

$$\frac{1}{54.05} = \frac{100 \text{ km}}{100 \text{ km}}$$

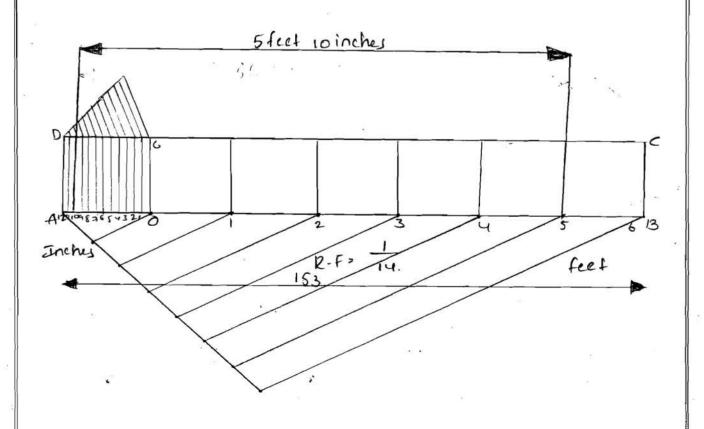

construct a scale of 1:14. to read feet and inches and long enough to measure 7 feet. show a distance of 5ft and 10 inches on it.

A-:

L.O.I.D = 153 mm.

marking distance = sfeet 10 inches morlength = 7 feet

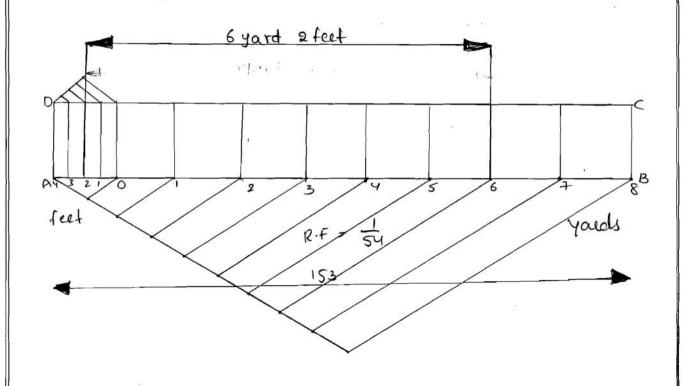

A:

construct a scale of 1:54 to show yould and feet and long enough to measure 9 youlds. Mark a distance of 6 yould & feet.

P-F = Length of object in drawing thereal length of object

· max length = 9 yards

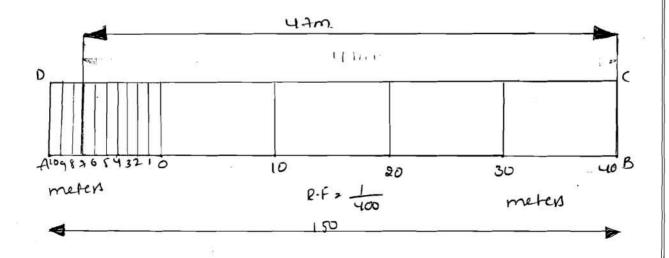

.: macking distance = 6 yard and 2 feet.

A cuse of 5cm side represents a tonk of 8000 m³. Find R-f and Construct a scale to measure up to 60 m and mark adistance of 47m

$$R \cdot f = \frac{5^3 \text{cm}^3}{8000 \text{ m}^3}$$

A:

1

A map is to be drawn with P.F 1:40 construct a scale to read in meters, dm and cm and long enough to measure up to 6m. show on it a distance of 3.8 um

scale -> m, dm, cm

max length of object = 6m

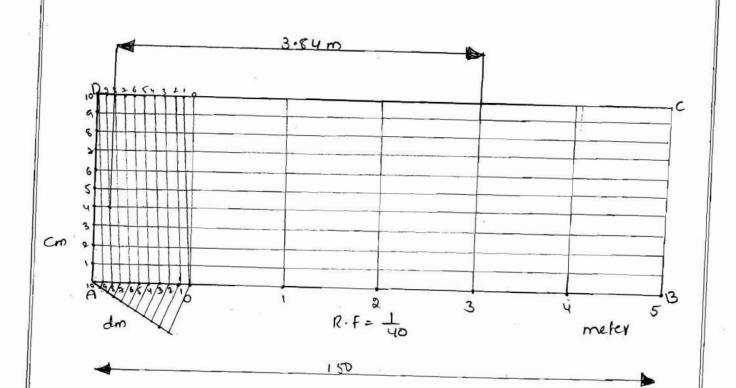

Marking distance = 3.84m

R.f = Length of object in drawing

Actual length of object.

$$L.o.I.D = \frac{6m}{40} = \frac{8 \times 150 \text{ cm}}{20} = 15 \text{ cm}$$

L.O.I.D = 150 mm

Construct a diagonal scale showing km, thm, Dm in which sum long line represents 1 km, and the scale is long enough to measure up to 7 km. Find the R.F and marking distance of 4.53 km on it.

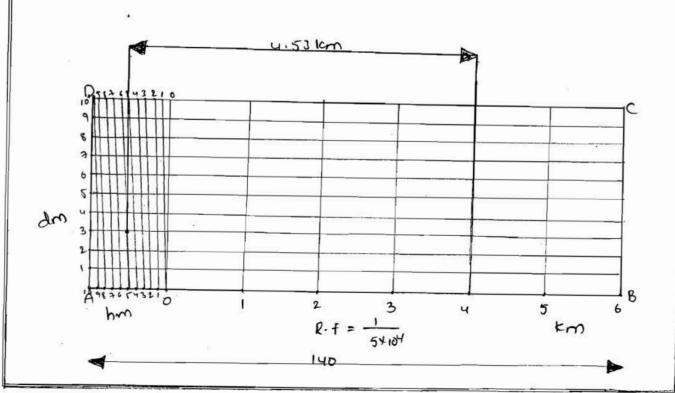

Scale -> km, hm, dm

A:

R.f = Length of object in drawing Actual length of object

L.O. I. D = 14 cm (01) 140 mm max length = 7 km

marking distance = 4.53 km.

AV

Draw a cliagonal scale of R.f 3:100 showing in meters, Im and com and measure up to 5m. Mark a length of 3.69 m.

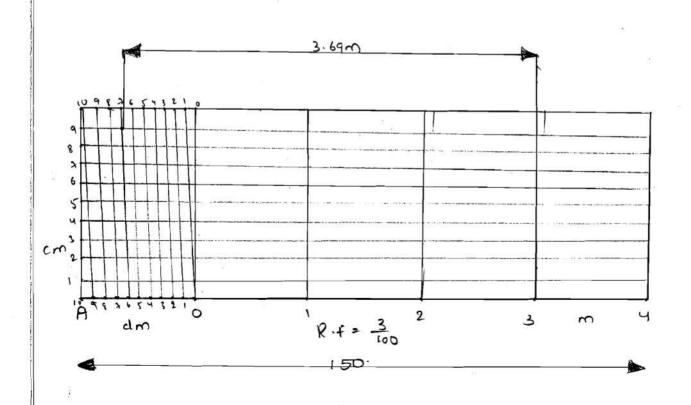

$$\frac{3}{100} = \frac{\text{L.o.I.D}}{5\text{m}}$$

L.O.I.D. 15cm.

L-0.I.D = 150mm.

max length = 5m

marking distance = 3 m com and 9cm (3.69m).

A:

The distance between two whies A' and B' is 300 km. It's equivalent distance on the map measures only 6cm. what is R.f? Draw a diagonal scale show look of km, Tenikm and km andicate on the scale the following distances.

(i) 525 km, (ii) 313 km and 258 km.

Distance blue two critics = 300 lon (A.L) chistonice on the map = 6cm (L-O.I.D).

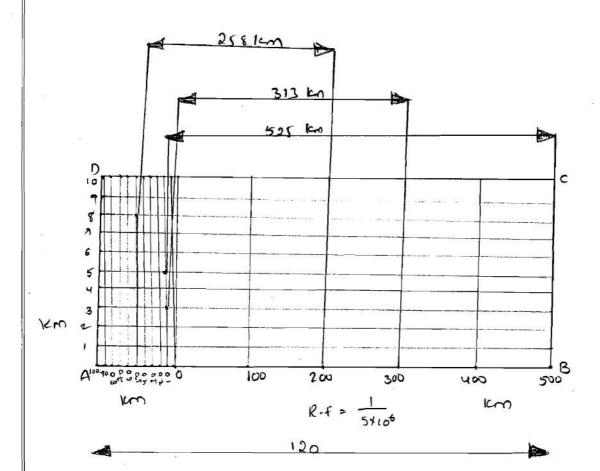

$$12 - f = \frac{6 \text{ cm}}{300 \text{ km}} = \frac{6 \text{ cm}}{300 \text{ kg scm}} = \frac{1}{5 \text{ kg s}}$$

max length = 600 km (: max marking distance is 525 km)

R-f = length of object in drawing = 
$$\frac{1}{5 \times 10^6} = \frac{1 - 0.J.D}{600 \text{ km}}$$

$$L \cdot 0 \cdot J \cdot D = \frac{600 \times 10^{5} \text{cm}}{5 \times 10^{6}} = 12 \text{cm}$$

$$L \cdot 0 \cdot J \cdot D = 120 \text{ mm}.$$

5.

on a map the actual distance of sm is represented by a line of 25mm long calculate the 12-1. construct a diagonal scale long enough to meesure up to 25m and make a distance of 19m and 11m.

A!

Place length = 25 m

P-f = Length of object in Drawing

Actual Length of object

= 25 mm = 25 mm = 1

5 m = 1

$$\frac{1}{200} = \frac{1}{100}$$

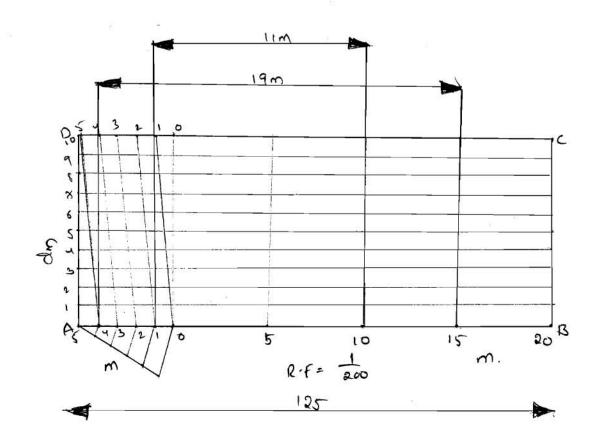

$$\frac{12.5}{25m}$$

$$\frac{12.5}{25m} = 1.0.7.0$$

$$\frac{25 + 100m}{200} = 1.0.7.0$$

$$\frac{200}{200}$$

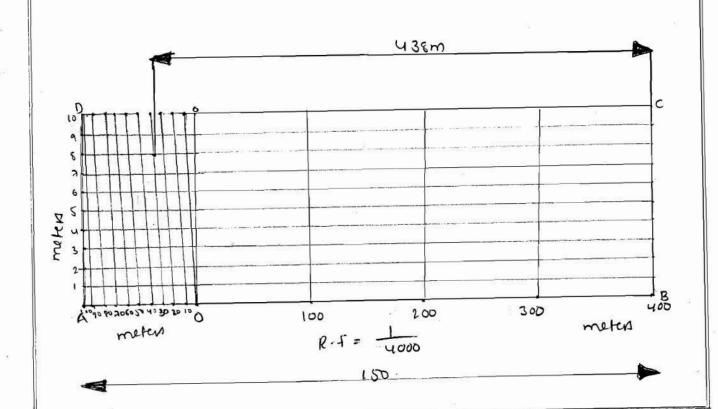

$$\frac{1.0.7.0}{200} = 12.5cm \text{ of } 125mm.$$

6. Construct a diagonal scale showing yards, feets and Inches. In which 2 inches long line represents 1.25 yards and it is long enough to measure upto 5 yards, marking distance as 3 yards 2 Feets and 10 inches. 2 inches = 1.25 yards 50% R·F = 2 inches = 2 inches 1.25 yards 1.25x3x12 inches R.F = 1062 = 245 max length = 5 yardy R.f. Length of object indrawing Actual Longth of object 2 = L·o·I·D = 5x3+12x7·5ucm 12 = L·o·I·D. 60.J.D = 20.32 cm & 20.Jcm (OT) 203m 39 2F 10 inches. Feet R.F = 2 45 yard.

\*

501:

The distance between two stations is looken and on amap It is shown by 30 cm. Draw a chiagonal scale and inclicate UG: 8 km and 32.4 km.

501:

$$R \cdot f = \frac{30 \, \text{cm}}{100 \, \text{km}} = \frac{30 \, \text{cm}}{100 \, \text{km}} = \frac{3}{106}$$

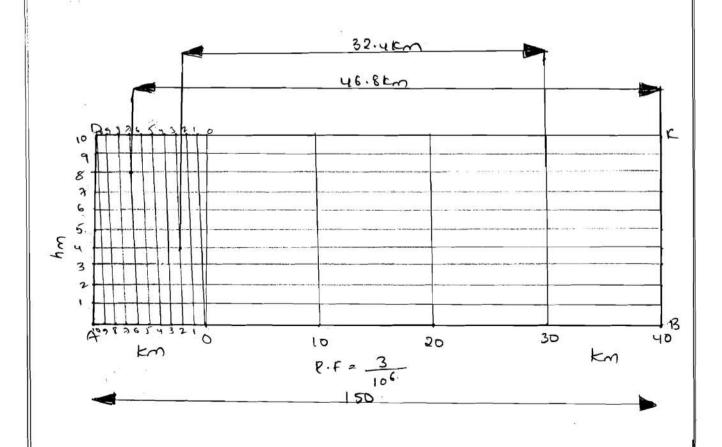

R.F = Length of object in drawing Actual length of object.

Mor length = 50 km (: max marking is 46.8 km).

$$\frac{3}{106} = \frac{1.0.3.0}{50 \, \text{km}}$$

$$1.0.3.0 = \frac{54 \, \text{kto}^{8} \, \text{k} \, 3 \, \text{cm}}{166} = 15 \, \text{cm} \quad 0.150 \, \text{mm}$$

marking distance = 46.8 km and 32.4 km

9. Construct a scale to measure km, 18 km and two km, in which 1 km is showing by 4cm. Mark on the scale at a distance.

Of 2.775 km.

Sol.

R.f = Length of the object in drawing Actual Length of object

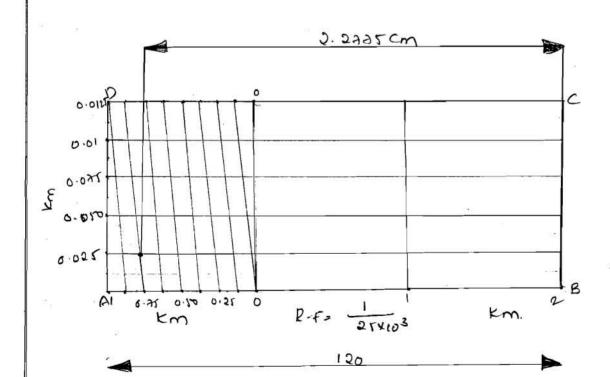

:: max length = 3km l: max marking is 2.735 km).

$$\frac{1}{25\times10^3} = \frac{1.0.1.D}{3tm}$$

$$1.0.I.D = \frac{3 \times 10^{3} \text{ cm}}{25 \times 10^{3}} = 3 \times 10^{12} \text{ cm}$$

-. L.U. I. 0 = 120 mm

Maering distance = 2.775 km.

1-0:-

construct a scale of R-f=0.5 to show midmicm and long enough to measure up to 4m.

Sol:

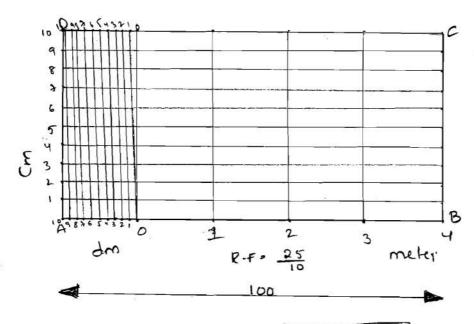

$$R - f = \frac{25}{10} = \frac{5}{2}$$

R-F = Length of object in drawing Actual length of object

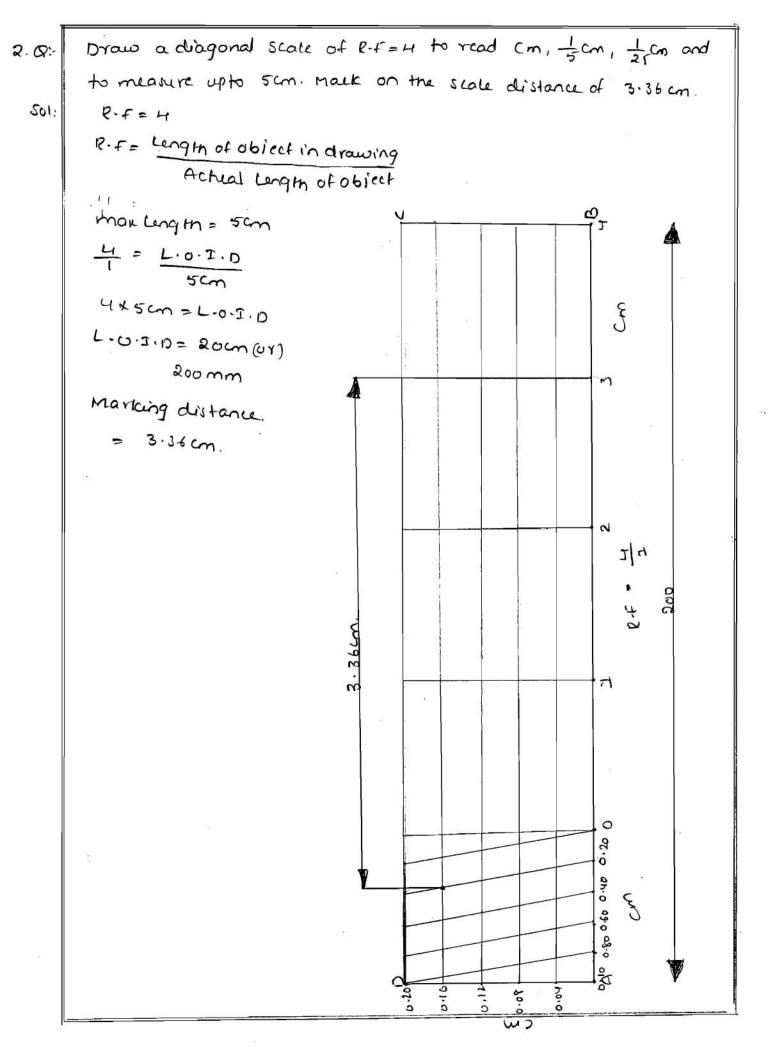

imax length = 4m

$$\frac{5}{2} = \frac{L \cdot o \cdot I \cdot D}{4m}$$

L.O.I.D = 1000cm (UT) 10,000 mm.

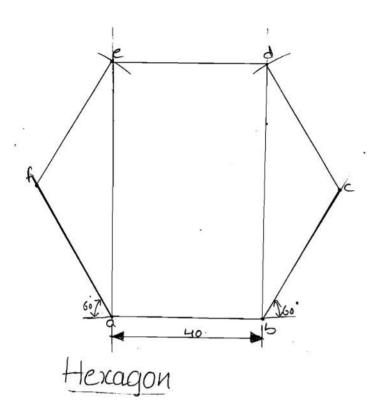

Scale : 1:100

3.03

a) Draw a regular hexagon of 40mm side wing general method.

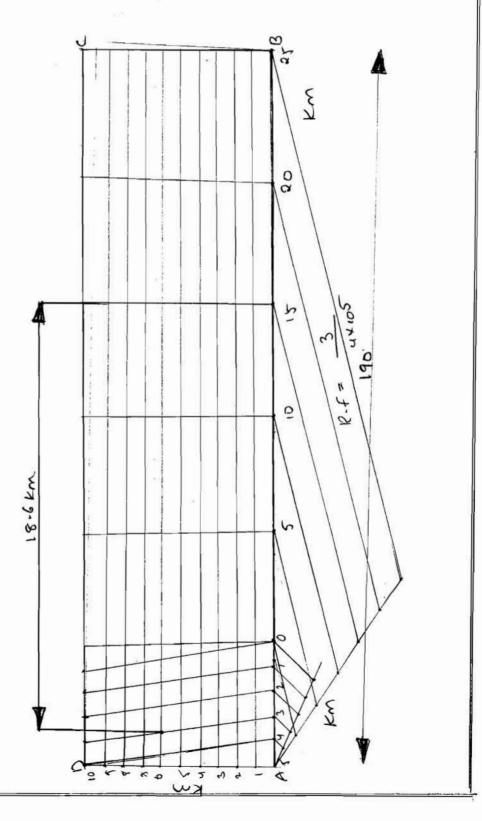

b) The distance between two points on a map is 15 cm. The real distance blu them is 20 km. Draw a diagonal scale to measure up to 25 km and show a distance of 18.6 km on it.

R.f = Length of object in drawing Actual Length of object

max length = 25 km

Sol

= 75 cm = 18.25 cm = 18.25 cm = 19 cm L.O.I.D= 19 cm (U) 190 mm Hauking distance is 18.6 km.

1

construct a vernier scale of 1:40 to read meters I'm and com and long enough to measure up to 6m and mark distance of 5.76m on it

Sol:

R.F = Length of object.

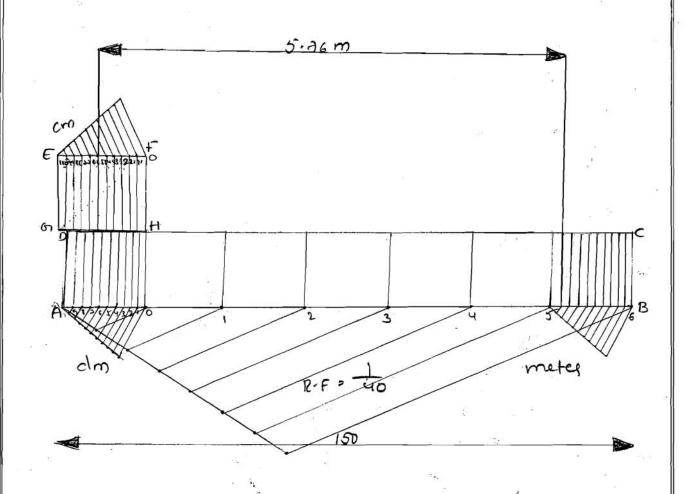

iman length = 6m

$$\frac{1}{40} = \frac{1 \cdot 0 \cdot J \cdot D}{4 \cdot 1 \cdot 0}$$

$$\frac{1}{6m} = \frac{1}{6m}$$

-. L.O.J.D = (5cm(01)150mm

: Marking distance > 5.76 m

2.

If I'm long line on a map represents a real distance of Hm. calculate the P.F. Draw a vernier scale Longenough to measure up to som show a distance of Hy. 5m on it

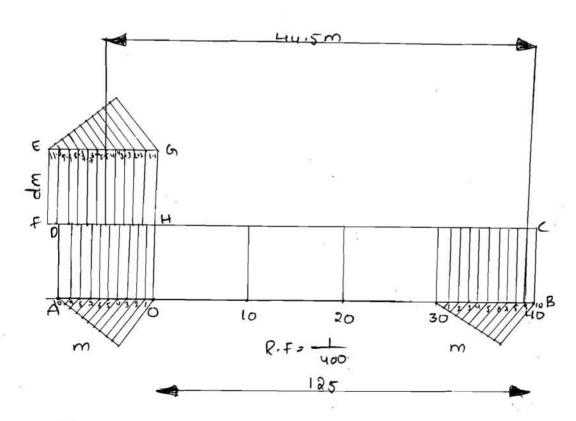

Soli

i max length = 50 m

R.f = Length of object

Achiel Length of object

1.0 1.0 = 12.5 cm os 125 mm marking distance = 44.5 m.

Vernier Scale

102

A real length of low is represented by a line of 5cm on a drawing. Find the P.F and Construct a vernier scale such that least count is 2 dm and measure up to 25m mark a distance of 19.4m on it

$$R \cdot f = \frac{5cm}{10m}$$
 $R \cdot f = \frac{5cm}{1041000m} = \frac{1}{200}$ 

mox length = 25m

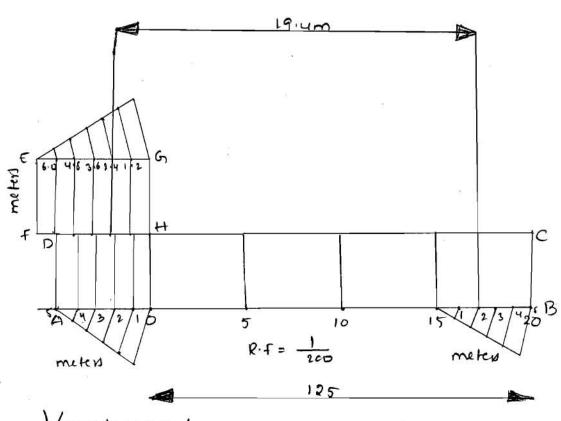

R.f = Length of object in drawing

Actual length of object

Linition

L.O. I 0 = 12.5 cm of 125mm

- making distance = 19.4m.

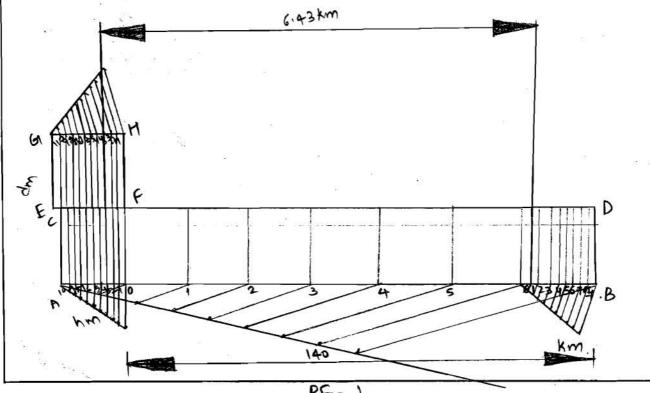

Vernierscale

LP.

SOI:

on a map rectangle of 125 cm x 200 cm seprents area of Gaso Km2. Draw a vernier scale to show Dm, and long enough to measure up to 7 km. show a distance of 6.43 km on it.

marting distance > 6.43 km

RF= 1

5. Construct a full site veening scale of inches and show on it.

Length of 4.67 inches.

Full site scale ratio = 1:2

SUL

martingth = 5 inches (mox marting 154.64).

Actual length of object

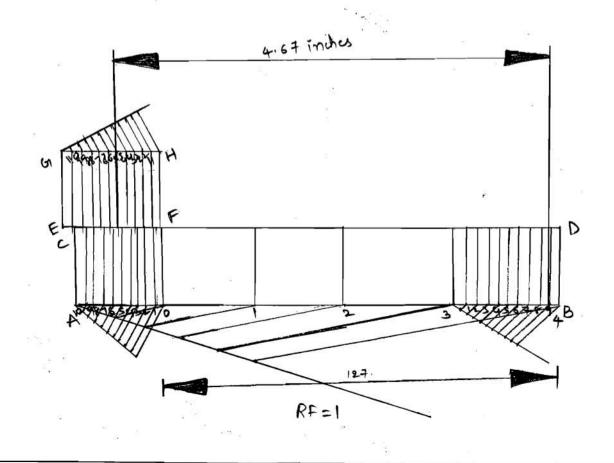

$$\frac{1}{1} = \frac{1.0.J.D}{5inches}$$

L.O.I.O: 5x254cm

> 12.7cm

> 127 mm

mailing distance = 4.67 inches.

# UNIT-II

# **Content**

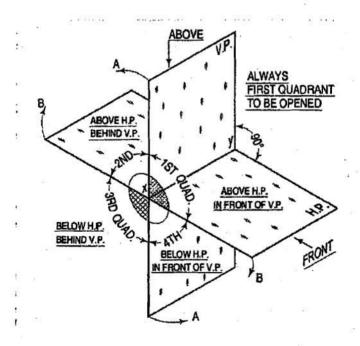

Orthographic Projections: Principles of Orthographic Projections – Conventions – Projections of Points and Lines, Projections of Plane regular geometric figures.—Auxiliary Planes.

## **Unit-II**

Orthographic Projections: When the projectors are parallel to each other and also perpendicular to the plane, the projection is called orthographic projection.

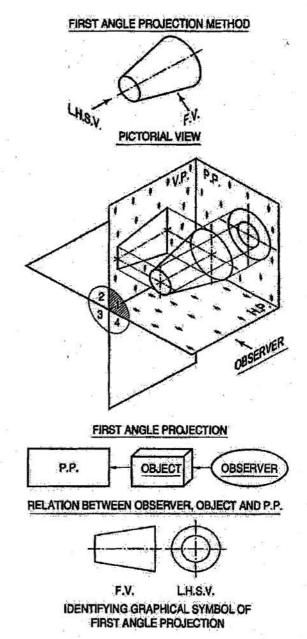

Planes of Projection: The two planes employed for the purpose of orthographic projections are calledreference planes or principal planes of projection. They intersect each other at rightangles. The vertical plane of projection (in front of the observer) is usually denoted by the letters V.P. It is often called the frontal plane and denoted by the letters F.P.The other plane is the horizontal plane of projection known as the H.P.

The linein which they intersect is termed the reference line and is denoted by the letters xy. The projection on the V.P. is called the front view or the elevation of the object. The projection on the H.P. is called the top view or the plan.

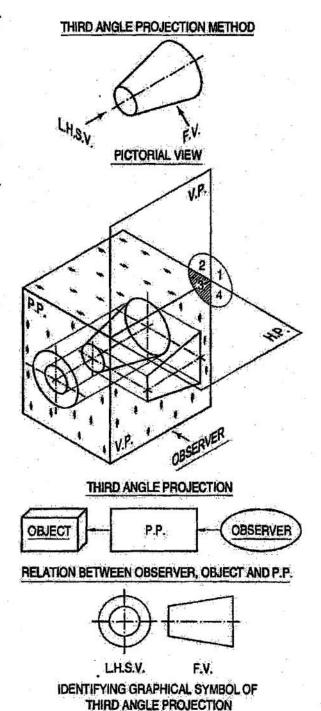

First-Angle Projection: We have assumed the object to be situated in front of the V.P. and above the H.P.i.e. in the first quadrant and then projected it on these planes. This method of projection is known as first-angle projection method. The object lies between the observer and the plane of projection.

In this method, when the views are drawn in their relative positions, the top view comes below the front view. In other words, the view seen from above is placed on the other side of (i.e. below) the front view. Each projection shows the view of that surface (of the object) which is remote from the plane on which it is projected and which is nearest to the observer.

Third-Angle Projection: In this method of projection, the object is assumed to be situated in the third quadrant The planes of projection are assumed to be transparent. They lie between the object and the observer. When the observer views the object from the front, the rays of sight intersect the V.P.

The figure formed by joining the points of intersection in correct sequence is the front view of the object. The topview is obtained in a similar manner by looking from above. When the two planes are brought in line with each other, the views will be seen as shown in fig. The top view in this case comes above the front view.

## **Projections of Points:**

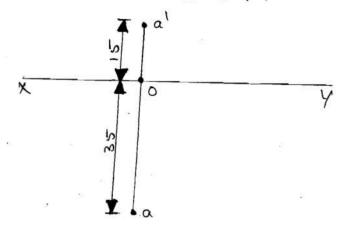

A point may be situated, in space, in any one of the four quadrants formed by the two principal planes of projection or may lie in any one or both of them. Its projections are obtained by extending projectors perpendicular to the planes.

One of the planes is then rotated so that the first and third quadrants are opened out. The projections are shown on a flat surface in their respective positions either above or below or in xy.

## Projection of points:

I

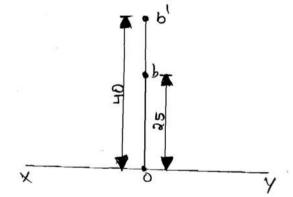

The Point A is 15mm above H.P. 35mm infront of v.P A -> 15mm above H-P 35mm infront V-P

401

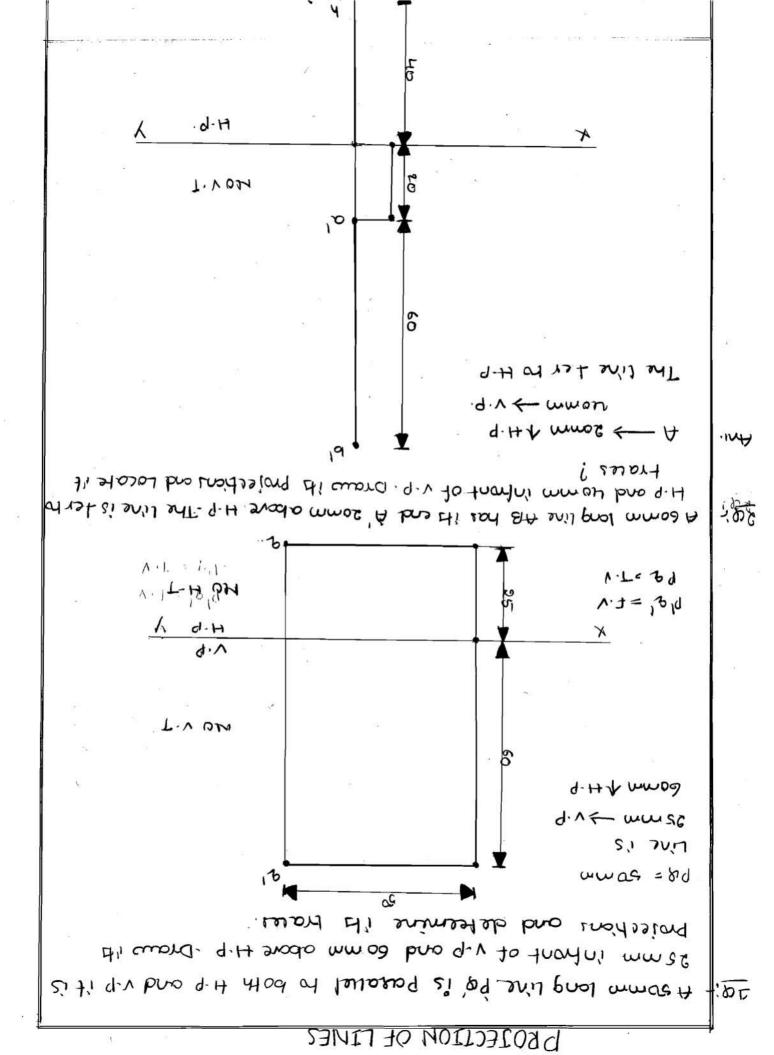

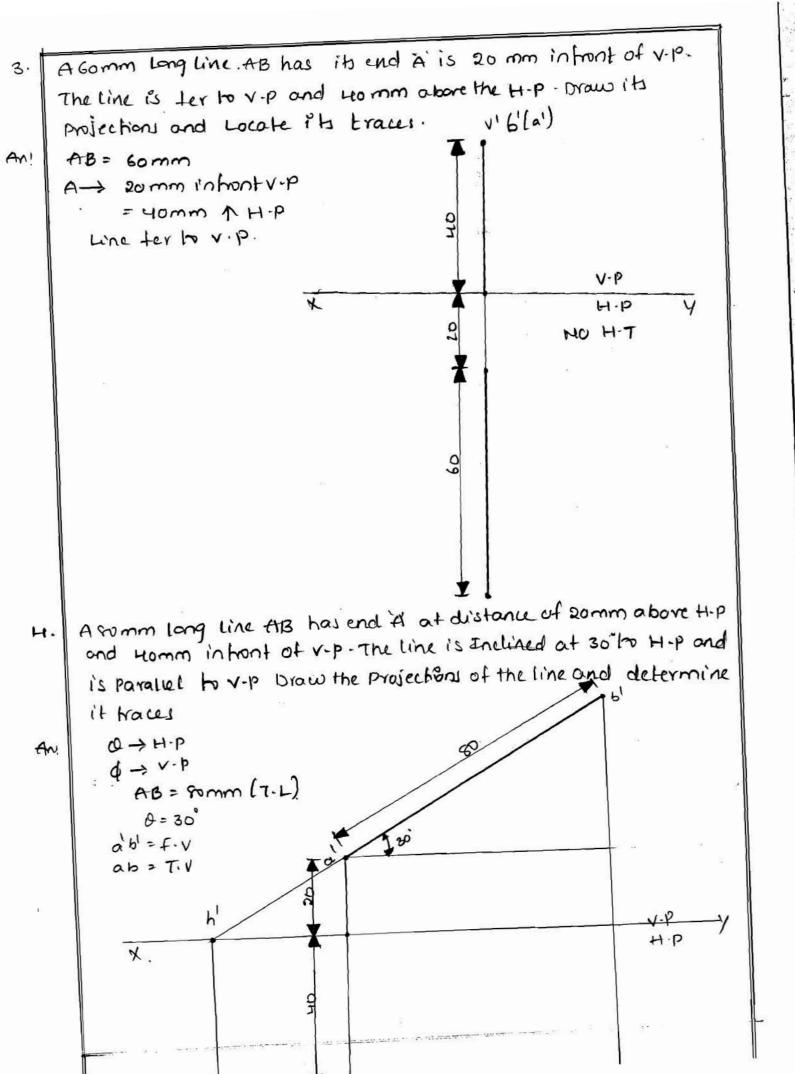

## **Projections of Straight Lines:**

A straight line is the shortest distance between two points. Hence, the projections of a straight line may be drawn by joining the respective projections of its endswhich are points.

The position of a straight line may also be described with respect to the tworeference planes. It may be:

- 1. Parallel to one or both the planes.
- 2. Contained by one or both the planes.
- 3. Perpendicular to one of the planes.
- 4. Inclined to one plane and parallel to the other.
- 5. Inclined to both the planes.
- 6. Projections of lines inclined to both the planes.
- 7. Line contained by a plane perpendicular to both the reference planes.
- 8. True length of a straight line and its inclinations with the reference planes.
- 9. Traces of a line.
- 10. Methods of determining traces of a line.
- 11. Traces of a line, the projections of which are perpendicular to xy.
- 12. Positions of traces of a line.

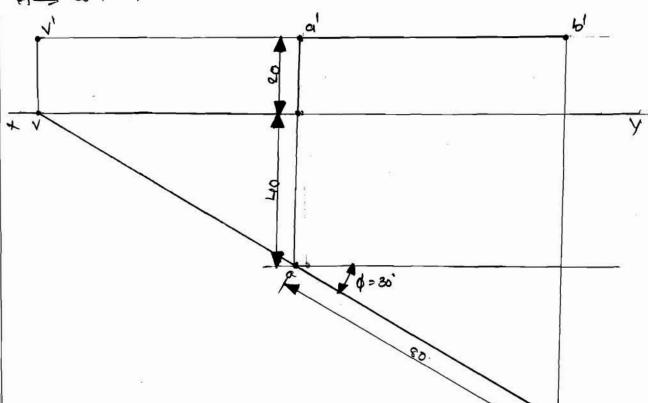

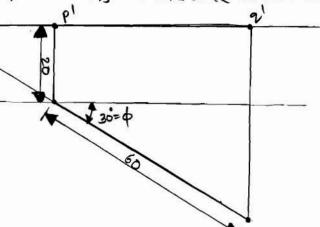

A somm Long line AB is Inclined at 30° to v-p and Parallel to H-P - The end A' of the line is 20 mm above the H-P and 40mm infront of the V-P. Draw the projections of the line and determine it traces.

## **Projections of Planes:**

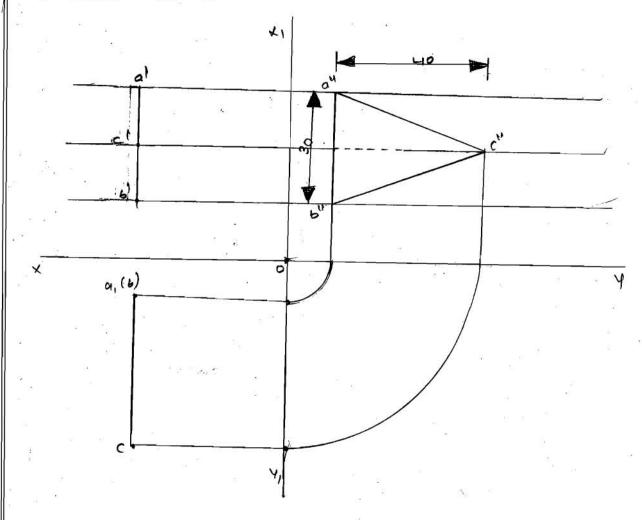

Plane figures or surfaces have only two dimensions, viz. length and breadth. They do not have thickness. A plane figure may be assumed to be contained by a plane, and its projections can be drawn, if the position of that plane with respect to the principal planes of projection is known.

1

A triangular plane is in the form of Isosceles triangle of 30mm side base and 40mm long altitude. It is kept in the first quadrant such that the surface is ter to both H.P and v.P. Draw its projections when the base is parallel to v.P.

1102

Base = somm attitude = 40mm.

**Projections of Regular Solids** – Auxiliary Views - Sections or Sectional views of Right Regular Solids

- Prism, Cylinder, Pyramid, Cone Auxiliary views
- Sections of Sphere

## **Unit-III**

#### **Projections of Solids:**

A solid has three dimensions, viz. length, breadth and thickness. Torepresent a solid on a flat surface having only length and breadth, at least two orthographic views are necessary. Sometimes, additional views projected on auxiliary planes become necessary to make the description of a solid complete.

### This chapter deals with the following topics:

- 1. Types of solids.
- 2. Projections of solids in simple positions.
- (a) Axis perpendicular to the H.P.
- (b) Axis perpendicular to the V.P.
- (c) Axis parallel to both the H.P. and the V.P.
- 3. Projections of solids with axes inclined to one of the reference planes and parallel to the other.
- (a) Axis inclined to the V.P. and parallel to the H.P.
- (b) Axis inclined to the H.P. and parallel to the V.P.
- 4. Projections of solids with axes inclined to both the H.P. and the V.P.
- 5. Projections of spheres.

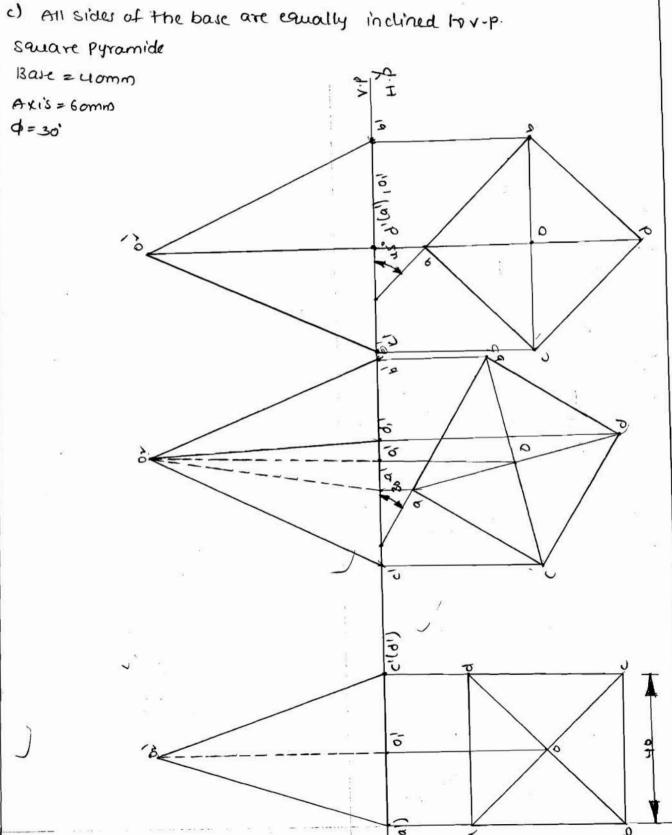

A square pyramid side of base 40mm and a Nis 60mm is reshing on its base on the H-p Draw its projections when

a) Aside of the base is Poualled to v.p

A = 6cmm

#### Sections of solids:

Invisible features of an object are shown by dotted lines in their projected views. But when such features are too many, these lines make the views more complicated and difficult to interpret. In such cases, it is customary to imagine the object as being cut through or sectioned by planes. The part of the object between the cutting plane and the observer is assumed to be removed and the view is then shown in section.

The imaginary plane is called a section plane or a cutting plane. The surface produced by cutting the object by the section plane is called the section. It is indicated by thin section lines uniformly spaced and inclined at 45°.

The projection of the section along with the remaining portion of the object is called a sectional view. Sometimes, only the word section is also used to denote a sectional view.

Section planes: Section planes are generally perpendicular planes. They may be perpendicular to one of thereference planes and either perpendicular, parallel or inclined to the other plane. They are usually described by their traces. It is important to remember that the projection of a section plane, on the plane to which it is perpendicular, is a straight line. This line will be parallel, perpendicular or inclined to xy, depending upon the section plane being parallel, per-pendicular or inclined respectively to the other reference plane.

**Sections:** The projection of the section on the reference plane to which the section plane is perpendicular, will be a straight line coinciding with the trace of the section plane on it. Its projection on the other plane to which it is inclined is called apparent section. This is obtained by

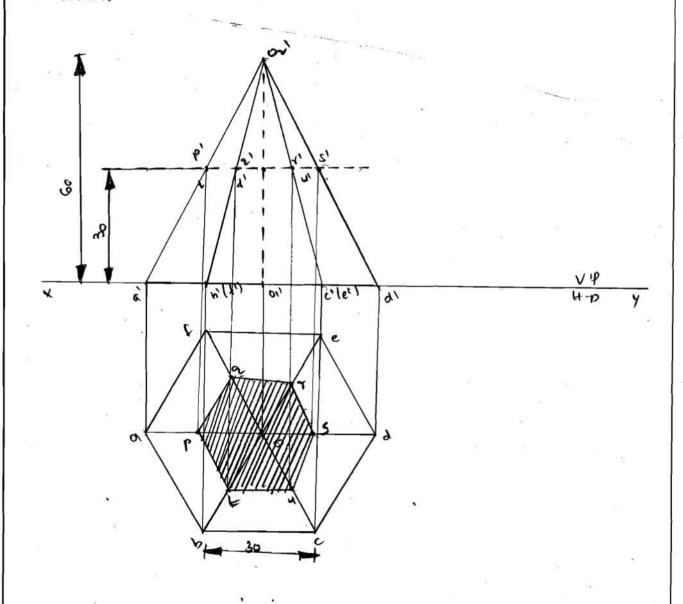

- (i) Projecting on the other plane, the points at which the trace of the section plane intersects the edges of the solid and
- (ii) Drawing lines joining these points in roper sequence.

True shape of a section: The projection of the section on a planeparallelto the section plane will show the true shape of the section. Thus, when the sectionplane is parallel to the H.P. or the ground, the true shape of the section will be seen in sectional top view. When it is parallel to the V.P., the true shape will be visible in the sectional front view. But when the section plane is inclined, the section has to be projected on anauxiliary plane parallel to the section plane, to obtain its true shape. When the section plane is perpendicular to both the reference planes, the sectional side viewwill show the true shape of the section.

A heragonal Pyramid of 30mm base side and 60mm Long axis rest with its base on H.p. and one of the edges of the base is led to v.p. Et is cut by a horitortal section plane at a distance of 30mm above the base. Draw the Ev and sectional T.V Heragonal Pyramid.

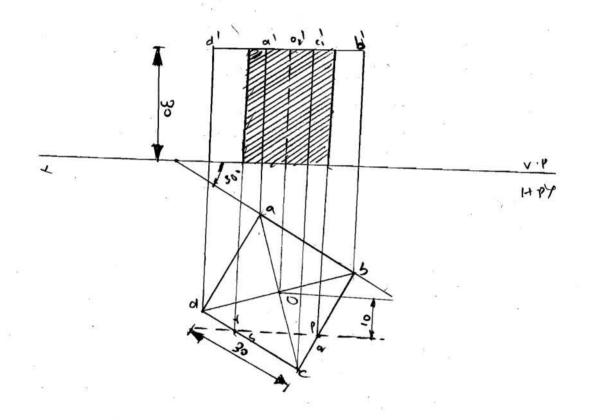

B = 3cmm A = 6cmm

3.

Acube of 30mm long edges is reshing on the H.P on one of its faces with a vertical face Inclined at 30° to the v.P. It is cut by a sectional plane paeallel to the v.P and lomm away from the axis and further away from the v.P. Draw the sectional front view and top-view of the cube.

Cube ball= somm  $\phi = 30$ 

3.

A triangular prism of somm base side and somm long axis is lying on the H.P on one of its rectangular faces. with its axis anclined at 30' to v.p. 2+ is cut by a tronstantal section Mane at a distance of 12mm above the ground prow its french. Sectional 70p view.

**Intersection of Solids:** Intersection of – Prism vs Prism-Cylinder Vs Cylinder

## **Unit-IV**

### **Development of Surfaces of Right Regular Solids:**

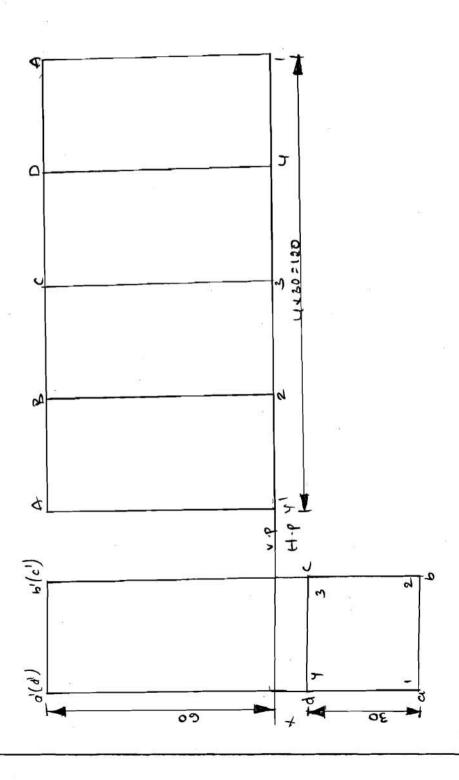

Imagine that a solid is enclosed in a wrapper of thin material, such as paper. If this covering is opened out and laid on a flat plane, the flattened-out paper is the development of the solid. Thus, when surfaces of a solid are laid out on a plane, the figure obtained is called its development.

#### **Intersection of Solids:**

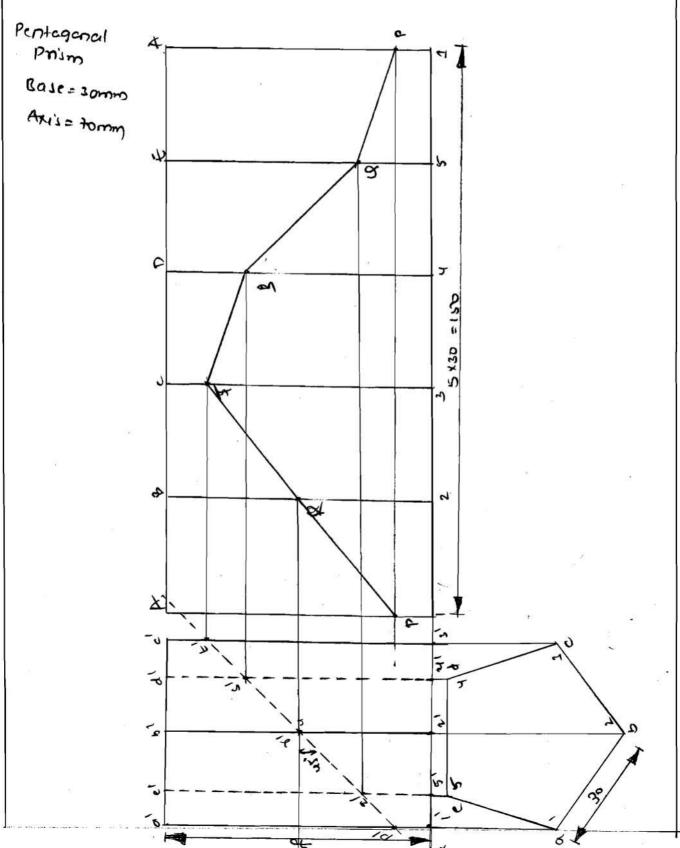

The intersecting surfaces may be two plane surfaces or two curved surfaces of solids. The lateral surface of every solid taken as a whole is a curved surface. This surface may be made of only curved surface as in case of cylinders, cones etc. or of plane surfaces as in case of prisms, pyramids etc. In the former case, the problem is said to be on the intersection of surfaces and in the latter case, it is commonly known as the problem on interpenetration of solids. It may, however, be noted that when two solids meet or join or interpenetrate, it is the curved surfaces of the two that intersect each other. The latter problem also is, therefore, on the intersection of surfaces.

1. A square prism of base side 30mm and axis 60mm is restring an its base on the H.P. with a rectangular face led to v.P develope the surface of the prism.

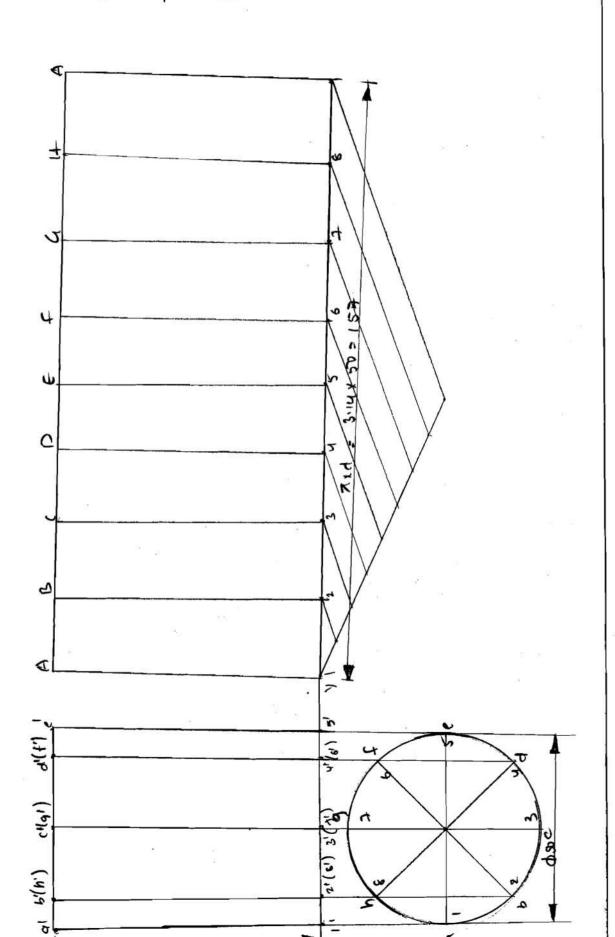

Base = 30mm, Square prism Axis = 60mm.

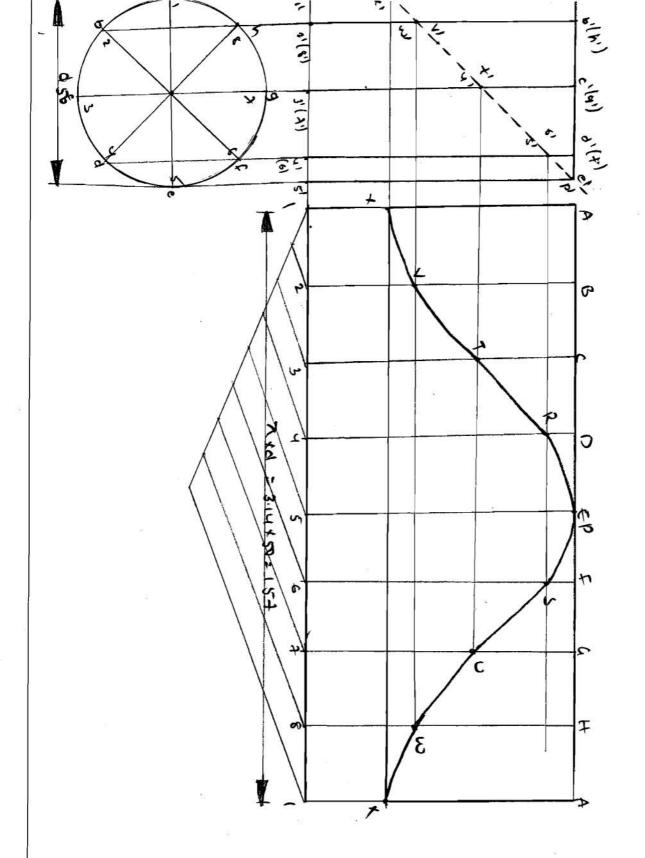

A Pentagonal Prism base side 30mm and axis form is ociting on its base on the H.p. with rectangular face led to the V.p it is cut by a A.I.p., whose V.T is Enclined at us to the Reference line and Passes through the midpoint of the axis. Drow the development of Lateral sueface at Truncated prism.

A cylinder of base diameter tomm and axis form is restring on the ground with its axis restricted brown the development of Lateral surface of cylinder.

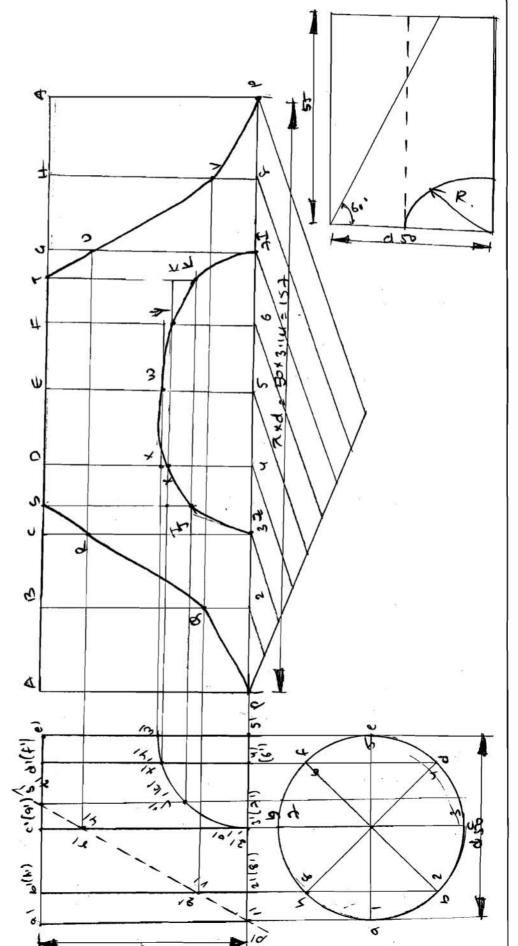

at its lateral surface.

Acylinder of base diameter somm and aris tomm is reshing on the ground with its and vehical. It is cutby a sectional plane ter to v.p. Enclined at us to the H-P, powing though the popular generator and cuts the out the generator. Oran the development

rigure shows the fiv of a truncated cylinder of diameter somm resting on its base on the H.P. Drows the development of its lateral surfaces.

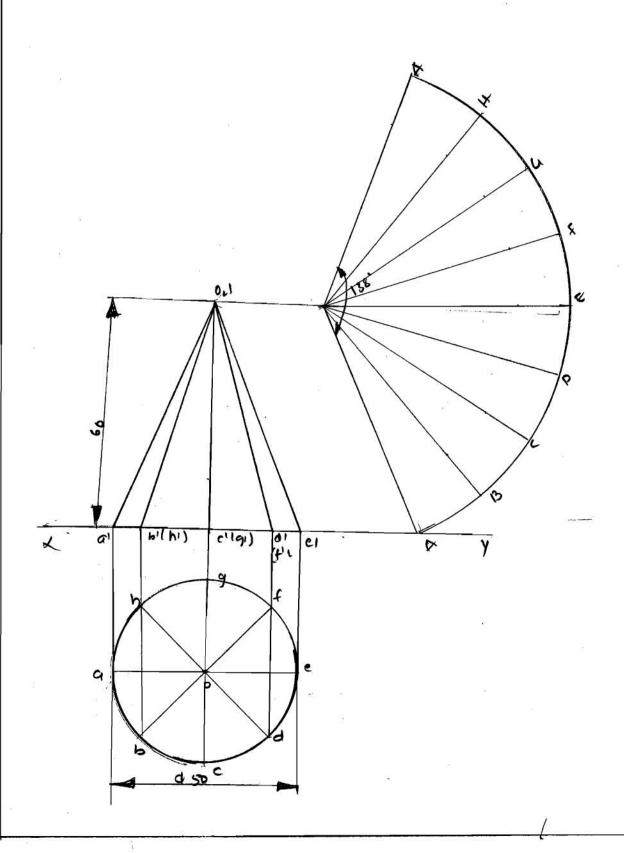

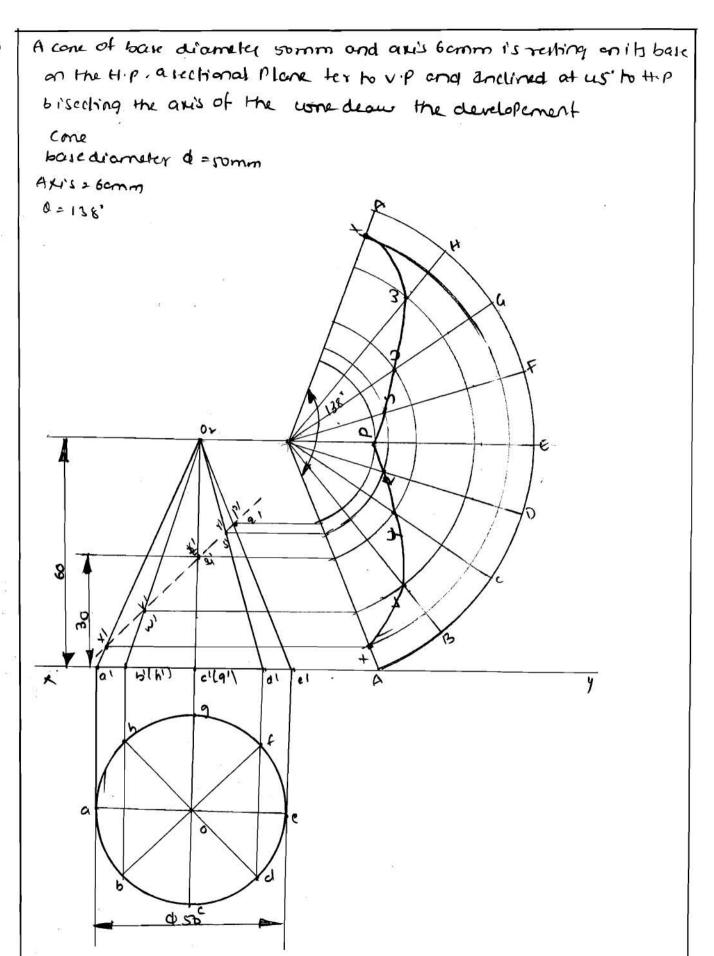

A come of base diameter somm and axis 60mm is reiting on its base on the H-p. Draw the development of its lateral surface.

Base diameter d=somm

& Isometric View

# Example 1

Draw the orthographic projections of Fig. 1

- Steps to draw projections.
- Identify surfaces perpendicular or inclined to the view
- Surfaces parallel to the view would not be visible in that view.
- First draw horizontal and vertical reference planes (easily identifiable on drawing)
- Start drawing from the reference planes.
